Does anyone know any good scanners to buy, or any accessories to
purchase. Also does anyone know nay good books to read about Scanners,
and frequencies.
Thanks
J.T.B

Has the Philly Fire Dept. moved to another set of freqs? I tried to listen to them the other night (haven't monitored them for several years) and heard nothing on 154.235...

Thanks.

Message-ID: <3ljp27$f7s@tuba.cit.cornell.edu>
Source record: 259128

The program I recently uploaded to simtel, fftscan, uses your sound blaster to show a real time FFT. The registered version has this voice activated recording feature, although it saves the sound in a raw format. The sampling is 8-bit 11kHz. The directory to look in is at oak.oakland.edu /simtel/msdos/hamradio/fftscan1.zip

Cheers,
Jan

Scan between 163.000 & 169.000 there are lots of sec ser freq there with most in the 165 area.407-415.

There's also the White House freq's for aide talk etc 32.2, 32.23, 164-166,407.45-415.8000.

Hope this helps!

9. My impressions on the BC3000XLT

Newsgroup: rec.radio.scanner
Date: 1995-04-01 00:00:00 UTC
From: bodoh@dakota.net
Message-ID: <3ljle7$lkg@westie.mid.net>
Source record: 259132

Hello,

After 1 week of ownership, I thought it might be
interesting to some to hear comments on the BC3000XLT. This
is by far the best scanner I've ever owned (PRO43, BC200XLT,
PRO2006, BC760XLT and many others). I have had no problems
with it - and for those interested in cellular (I of course
am not...) it receives it clearly from 1005 to 1030 Mhz. It
still is not an AOR8000 (I have heard good things about them)
but it is the best scanner available under $600. I shopped
around and found mine at EEB for $369.

It still would be nice if it had;

A soft vinyl case (I bought the $12 leather case)
A higher capacity (> 600 ma) battery pack and rapid
charger
A signal strength meter

These are minor detractors of an otherwise excellent radio. It
has the best intermod rejection of any I've ever used. In a
high RF area (Maryland) it performed flawlessly. The one time
I experienced slight intermod, the built-in attenuator took
care of the problem. I particularly like the intelligent
search and store and the 20 scan banks - both of which are handy
for those of us that travel a lot. I like having a radio that
can receive FM broadcast and TV audio for times when I would
like some tunes or news. I am still happy with my purchase
and am likely to hold onto this one until they come out with
their next model. Bye...

Tom, N0YGT

10. Getting on to PoslDoom

Newsgroup: rec.radio.scanner
Date: 1995-04-01 00:00:00 UTC
From: Joan Rosenthal <Joan.Rosenthal@sydpcug.org.au>
Message-ID: <796729642@f505.n712.z3.ftn>
Source record: 259133

Hi John
How did the Canberra tournament go? I heard Alan W won, which was a coup for him.
I still haven't got onto PoslDoom or MarlDoom. What happens is that I get through via Telnet so that I can see writing on the "blackboard" (such as instructions to type help). I can also type onto the blackboard (such as "help", or requesting a password according to the instructions); but when I press Enter after that there's no response and the cursor just goes back to the start of the same line - the one I was typing on.
I thought maybe the request might register anyway, but there's no evidence that it does, i.e. no message comes back a few days later from John Chew as promised.
Are you coming through Sydney by any chance? I was wondering if you were (Bob mentioned a family holiday to Lake Cathie), would you be able to drop in here and see if there's any way you can assist.
And have a game of course if time permits.
In frustration,
Joan.

```
GRE Supter Converter II, receiving range: 810MHz to 912MHz.
Use it to receive frequencies between 810-912 MHz and convert
them down to 410-512 MHz, best for scanner like BC100XLT or
simular scanner. Use 9 volt battery.
Still with warranty registration card. $50 + shipping.

Are you *sure* it's unlawful? I recall that it is now confidential and
no longer admissable as evidence without a court ordered wire tap, but
that's not the same thing.

I sent my 2004 in 2-3 years ago because it was totally dead. The extended warranty was still in effect and they repaired the unit. Everything was intact when I got it back except someone had programmed 400.0000 into channel 1. Maybe a diagnostic test did that or perhaps they were having fun with me.

Your results may vary.

We offer an inexpensive product here at K & L Technology.
The "Message Tracker" allows you to decode pager messages
on your pc or laptop for $99.95

Some of the features include:

* Decodes both ASK and FSK signals
* POCSAG - ASK (512 1200 2400 baud)
* POCSAG - FSK (512 1200 baud)
* GOLAY - (600 baud)
* Output to screen and file with time stamp
* Ability to monitor messages only from your capcode address list
* Monitor all messages on channel
* Display buffer to review previous messages

Automatically detects the format type (POCSAG or GOLAY), polarity,
and baud rate for you. This is handy when monitoring a channel
what switches between different formats and various baud rates.

All you need is a scanner or receiver. It uses the audio from the
earphone or speaker jack. Our adaptor fits on your com port, and
requires NO external power.

You can e-mail me at KLTsupport@aol.com for a request on
additional information about our product via email.

Regards,
KLTsupport (Larry)

In answer to the thoughts of "stealthyness", if properly
used, your radar detector won't help you.
When using radar, I should have the unit in the "standby" mode
until I see a target that I visually estimate as being over the posted
limit. I then aim the device and turn on the beam. By the time your
detector goes off, I've already locked on to you. Yes, other violators
may get warning at this point, but who cares? I'm going to be busy
writing you until they are past anyway.
The only reason detectors are of any use is because many
traffic cops don't use their radar properly. This can be because
they are poorly trained, or because they are just plain lazy. Either
way, I guess it works to your benifit. Personally, I feel sorry for
people that have detectors. If you come through this area, you've just
wasted your money.

>While listening to my Yaesu FT-51R, I had it in its DTMF decode mode, and
>was tuned to a frequency with a lot of DTMF activity.
>Periodically, the letter F would appear in place of a number.
>The tone corresponding to the F was singular. ie One tone produced the F.
>What is this?

Hi Dave: On some DTMF keyboards if you push two buttons in
the same row or same column you'll get a single tone. You're
51R might be programmed to read F (maybe F = failed tone)
when it hears that particular single tone.

Someone has posted a followup stating that the F-key (on a 16-button
pad) was detected by your 51R but that can't be correct since the
F-key will generate a dual-tone, not a single-tone as you stated.

>

I am a professional car stereo installer and our shop sells scanners which I install alot of...Maybe I can answer some of your questions. you can put it in the empty din spot in your dash, you will have to take it apart and make some little brackets to attach to something back there so its secure, then we usually cut s piece of plastic to make a faceplate so it looks good. A cellphone antenna works great with most scanners but glassmount antennas are not very sensitive at all!! I wouldnt recomend a glassmount at all! they are OK for your cellular phone cause most cities have tons of cells and your always close to one and who cares how sensitive it is! but for a scanner sensitivity is everything, I have used a little adapter that hooks the scanner to the cars regular AM/FM antenna with great sucess!! it is cheap around 15$... Personally I use cell antennas mounted to the roof of my ford explorer with great results! I have a cell antenna for my pro-2006 and another one for my kenwood RZ-1 which even works acceptably down into the shortwave bands! (RZ-1 has coverage from .5 to 905 MHz)....

From: stew@sam.neosoft.com
Message-ID: <stew.31.0079AC0D@sam.neosoft.com>
Source record: 259150

I've got a few things for sale:

- One Ranger 2950 ten meter rig in absolute mint condition. Has instructions, documentation, all original brackets and accessories and original box. I am selling this radio as a package deal with a 250 watt 10 meter HF amp. This amp has a built-in pre-amp, and a toggle switch for SSB/AM operation. This amplifier may ONLY be used by a licenced amateur operator. You also get a high power SWR/power meter (up to 1000 watts) with mounting bracket. All this for $400.00.

- Pro-34 hand held 200 channel fully programable scanner. This scanner covers all the usual frequencies as well as 800Mhz. It is cellular restorable. $175.00.

- Uniden Bearcat 200XLT hand held 200 channel fully programable scanner. This scanner also covers all the usual frequencies and 800 Mhz. It is also cellular restorable. $175.00.

Please email me if you are interested in any or all of the above. Thanks!

Hi people!

I just bought a BC200XLT UNIDEN one week ago. Now, I need money for computer related equipment. So, I'm selling it. Please, if you want more informations about the scanners (features..), email me at:

coaxial@biko.llc.org

Regards,
Martin Rosa

Note: It's a Brand new. Never used (1 week!)

>Don in Dallas

Unless an outdoor antenna is protected (which implies the
antenna is at DC ground), I strongly urge it not be used
during an electrical storm and that it be disconnected and
grounded when not in use. For a discone, that
means connecting *both* the inner and outer conductors of
the coaxial cable to a good ground.

The classic discone antenna is not at DC ground. This can
be verified by an ohmmeter, which will measure infinite
resistance between the center pin and shield of the coax
cable feedline.

Unless it is tiny, or protected by a larger grounded
structure (i.e., within the "cone of protection"), an
ungrounded piece of metal up in the air will almost
certainly build up a static charge and that's true of the
discone. The static charge can build up until the voltage
is high enough to find a way to ground, e.g., by an arc.

Although I do not recommend this, a simple experiment will
demonstrate the static buildup on an ungrounded discone: If
you disconnect the coax cable from your scanner when there's
an electrical storm nearby, you can watch blue sparks dance
between the center pin and outer shield of the coax
connector.

That's a lot of voltage, more than enough to damage the
front end of an unprotected receiver.

Many scanners have a resistor or choke shunted from the
antenna jack to ground to bleed off the static charge.
Choke L1 (1 uH) performs this function in the PRO-2006.

Also, I would not mount an ungrounded discone at the *top* of a
tower. I own a discone, but it is located within the
cone of protection of a taller, grounded antenna.

The AT&T book "Telecommunication Electrical Protection"
(copyright 1985, select code 350-060), contains some
interesting information about lightning protection. Specifically,
it explains the cone-of-protection better than I can:

"Tall grounded structures, 50 feet high or less, such as
towers, buildings, and antenna masts provide a discharge
point for lightning strokes, thus presenting a degree of
protection for lower structures nearby. This concept is
referred to as the cone of protection principle. A tall
structure shields lower structures located with an imaginary
cone constructed using the apex of the taller structure and
a finite base radius. Almost perfect protection is provided
to those structures whose highest points fall within a 1:1
cone (where the radius of the base equals the height of the
mast). A large degree of protection is also provided to
structures with a 2:1 cone...."

The amount of misinformation on the newsgroups is amazing! I used
to be a fireman back in Southern California and none of our
apparatus had 154.28 MHz available. I doubt any agency not primarily
operating on VHF-hi would have that freq available, for that would
mean having two transceivers aboard the apparatus, and two antennas.

I've got several items for sale:

- Ranger 2950 in absolute mint condition with instructions, original box, mounting brackets, etc. I am also selling a 250 watt HF amplifier with this radio. It is an all-mode amplifier with a built-in pre-amp and SSB/AM delay toggle switch. This amplifier can ONLY be used by a properly licenced ham radio operator. I am also including a high power SWR/power meter (1000 watt max) with mounting bracket. All for $375.00.

- Pro-34 200 channel hand-held programmable scanner. Covers all the standard bands as well as 800Mhz. Can be modified for cellular. Great shape! $175.00.

- Uniden 200XLT 200 channel hand-held programmable scanner. Also covers all the standard bands and 800Mhz. Can be modified for cellular. Excellent condition. No promises, but I think I have the original case for this one as well. $175.00.

Email if you are interested in any of the above.

There's also an Opto456 which is a board made by Optoelectronics and sold by various scanner dealers. Its quite similar to the CE-232.

The Opto456 is easier (from what I hear) to install than the Opto456 but one feature the CE-232 has is the ability to reprogram the scanner. The Opto board uses a slot in the PC and when the program is running takes control of the scanner and all controls are done from the computer. The scanner can still be used as usual when not running a computer control program.

I have the Opto456 and am very pleased with it. I had previously thought about getting the CE-232 but the time and expertise to build it kept me from buying it. I think the CE-232 takes a good day to install if you're good electronically while the Opto456 took me 2 or 3 hrs and I was really taking my time. Also it should be noted that the Opto requires no soldering while the CE-232 does.

Hope this helps.

April 1, 1995

In a surprise move today, the Federal Communications Commission (FCC) proposed that all persons using cordless phones must identify using the same guidelines now in effect for amateur radio operators:i.e. every 10 minutes and at the end of the conversation. This proposal is aimed at helping cordless phone users identify other cordless phone users on the same frequency that may interfere with their own conversations. It is hoped that this will be a stopgap measure until more frequencies can be assigned to decrease interference.

It is believed it will also aid in the identification of cordless telephone users by persons listening in on the conversations with their scanner radios. Some on the Commission opposed the proposed rule change. "Why should we make it easier for people to listen in?" one member asked. "The next thing you know, everybody will be sending QSL cards around their neighborhoods and coming up with 'Worked All Neighbors' awards! It's preposterous!". The ARRL is said to be studying the feasibility of awards for various categories. Please contact the ARRL directly for further information.

Ramsey has a few radar related kits, and many others of interest to radio hobbyists. In particular, they have a microwave-based motion detector. I don't know what frequency it uses, but I have wondered if it could be used to trigger radar detectors. I know some of the commercial microwave motion detectors in stores will trigger radar detectors when you drive by the store. I think the kit was pretty cheap (lent out my catalog) but you can request a catalog by calling Ramsey at 800-4-HOBBYKITS.

By the way, Ramsey also has a radar gun kit for speed detection. You supply a couple coffee cans for the waveguide/horn. Again, I have no idea how well it works, but it sounds interesting.

But, you don't need an FCC number...
The serial number will tell you. If the serial number has an "A" prefix
(A12345678), the '43 can NOT be modified.
Which, of course, brings up another question: Are two versions of the '43
being made? "A" prefix & non-"A" prefix models?

52. TRADE: A new PRO-46 with an old PRO-43...

Newsgroup: rec.radio.scanner
Date: 1995-04-01 00:00:00 UTC
From: allenw@teleport.com
Message-ID: <3lj6j0$27i@linda.teleport.com>
Source record: 259214
Cross-posted to: rec.radio.scanner,rec.radio.swap

I have a proposition to make...

I am a ham and I need to monitor the 220mhz band as much as possible. After this last X-mas I got a PRO-46 to monitor some of my repeaters. At the time, I didn't know that any scanner could get the 220 band (that is without putting out an arm and a leg to buy it.). I recently learned that the PRO-43 can infact RX 220. This would solve all my problems! Right now I have to link my 220 and 440 mhz repeaters together to monitor the lower band. I need to stop that link cause of heavy traffic on my system. The PRO-43 is an older radio, but I think it is worth the age to get that band. (If you're not a ham, 220 mhz is boring!).

The scanner comes in box, with charger, and NiCads on their last legs. There is not a scratch on the radio, and I maybe listened with it for only ten hours at most in this whole time! The radio was modified to RX 60mhz and still RX 50mhz while in mem (or limit). I like the 46 a lot, I just want my 220 band. You can call your local Radio Shack and get all the specs (This radio made it in before the 95' FCC deadlines). Last but definitely not least, it DOES RX 800mhz (can still be moded for cell).

(Now as far as the 43 is concerned I would PREFER to have cell restored.)

Please email me if you are interested or have any questions/comments...

Thanks for your time!

>using both batteries at the same time thereby discharging each one less.

It's true, deep discharges will shorten a battery's life. Special
deep cycle marine batteries are very heavily over-built to tolerate
this abuse, but it is still abuse. You'll get longer service life
from a battery if you limit discharges to the point where the battery
is reduced to 80% capacity, IE only 20% of the battery's nameplate
capacity is really usable if you want maximum service life. A battery
is not like a muscle, exercise isn't good for it, and resting it won't
make it stronger.

The purpose of using two batteries alternately is so that you won't
find yourself in a situation where *both* batteries are dead. This
is a commonsense way to operate a vehicle battery system. Using
both batteries together would require you to watch discharges very
carefully to avoid getting caught in this situation.

Lead acid batteries can tolerate an occasional deep discharge to
nearly zero terminal voltage. It's not good for them, but they'll
usually survive.

>The question that comes up is, "Does this apply to Ni-Cad batteries as
>well?". I have been told to discharge my Ni-Cads almost completely
>before recharging to avoid the dreaded "memory effect". However, I
>don't want to shorten the battery life unnecessarily. Any advice on how
>best to manage Ni-Cads?

NiCad chemistry is different, but some of the same ideas still apply.
The manufacturers typically rate their batteries for 500 full charge/
discharge cycles, or several thousand partial charge/discharge cycles.
The dreaded memory effect is mostly hokum, though you can get a voltage

depression effect with repeated partial discharges to exactly the same terminal voltage followed by *overcharging* the pack. This is usually caused by equipment with automatic voltage cutoff circuits that are set too high for the battery being used.

While individual NiCad *cells* can tolerate discharge to zero volts, NiCad battery *packs* cannot. You should never discharge a *pack* to less than one volt per cell, or you run the risk of *reversing* the polarity of the weakest cell in the pack. This is always damaging. So for example, a 10 cell 12 volt pack should never be discharged to less than 10 volts.

56. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1995-04-01 00:00:00 UTC
From: bill@thd.tv.tek.com
Message-ID: <3lj17k$9sb@news.tv.tek.com>
Source record: 259218
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 22-Feb-95]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing FCC data, you might want to consider forming a co-op of people in your area to share the cost. As far as I can tell, this is legal since the information is in the public domain. However, the software supplied to view or manipulate the data is usually copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $103, and the mapping version is $173.

Floppies are available by state for $43 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. The US Index CD also covers the entire US but comes with much a more powerful database manager. Regional CDs cover subsets of the US but provide more detail about each license. Finally, the mother of all databases is the seven-CD Frequency Set, with data organized by frequency.

Spectrum costs $37, the US Index is $87, regional CDs are $107 each ($465 for the complete five-disc set), and the frequency set is $1515. Data is updated quarterly (the latest data is from Nov 94). PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), or Pergrim@aol.com (email).

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

| Developed by long-time Usenet contributor Bob Parnass, this service
| provides a custom report of frequencies, callsigns, and licensee names for
| a specified area in any of the 50 states. Coverage areas of 4 to 256
| square miles will be chosen by Bob depending on transmitter site density.
| The report includes a color plot with transmitter sites marked.

| To create the report, Bob requires the latitude and longitude (or nearest
| street intersection) of the center location. Reports are $20 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services and all frequencies. Data is updated approximately every six months (last update was Sep 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts

available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

58. Excellent Advice on Frequencies

Newsgroup: rec.radio.scanner
Date: 1995-04-01 00:00:00 UTC
From: jwayda@netcom.com
Message-ID: <jwaydaD6Cprt.F2z@netcom.com>
Source record: 259220

This newsgroup seems to b e flooded with requests for local frequencies. Many times the person that posted the request does not get an answer for one of the following reasons:

1. No one knows reading this newsgroup knows the frequencies for your local area.

2. Some people are so tired of seeing these requests that they ignore them.

If you want frequencies for your local area (city, county, etc) check out the Police Call publication available at Radio Shack. You will most likely find the frequencies that you need plus many more. Radio Shack also sells an Aircraft Frequencies publication that is quite excellent.

Also, do not ignore your local ham radio store! National stores like Ham Radio Outlet, and even many local Ham radio Stores usually have many publication on scanning. These publications usually include Scanner modification handbooks by Bill Cheek and books that contain unpublished frequencies. There are also excellent books for the novice.

Good Scanning....

Jim

From ftp: You can get all sorts of FCC stuff, like dockets, press releases, Orders, permit announcements (I think) on the anonymous ftp file server at the fcc.

Address is fcc.gov

I don't know if they have a web page or not. FTP directories can get kind of cumbersome to dig through.

Hope this helps!

Good one, they don't have FCC numbers on (at least over here) so you
couldn't tell that way. Just make sure that you are happy the
person/people selling it actually know what they are on about :-)

Alternativly take a little Phillips 'driver along together with
a soldering iron and make sure the bottom board has a 4 place matrix
for the smc diodes !

All the best

> if I zapped cars that went whizzing by me...

There was once a magazine construction article which described how to make
a small 10.525 GHz transmitter with a strip antenna, which would set off
X-band radar detectors within a half-mile or so. Since then a couple of
companies have offered kits (pre-assembled or build [AND **TUNE**]
yourself versions).

They disappeared - some said because the FCC wanted them certified first -
but I've started seeing ads again. Cruise through electronics and ham
magazines for ads from Innotek, Electronic Rainbow ("The Zapper") and JDR
Microdevices (a computer parts outfit who are reselling a lot of the
Rainbow kits). They are built into the "transmitter - with - 9V - battery -
compartment" black plastic boxes that Radio Shack sells.

Oh brother. So, what is a safe speed? On a freeway? Is it 65? Do you drive 65? Radar detectors are a device that helps you avoid taxes! Speed enforcement is NOT safety oriented. If it was you'd see cops in school zones, not freeways.

Uh, hate to bust your bubble about your great idea, but the Uniden Bearcat scanners have that feature pretty much built in. The way it works is that the memory channels are banked into 10 banks (for the 100XLT and 200XLT, anyway), and the first channel is the priority channel for each bank. That is, (on the 200XLT) channels 1, 21, 41, 61, etc. through 181 are all priority channels.

If you are scanning normally and something happens on a non-priority channel, your scanner will stop there and let you monitor that channel, but will sample the priority channels in order (1, then 21, then 41, etc.). If it finds activity on channel 61, for example, it will jump to that one, and then monitor 61 (instead of the non-priority channel), and it will continue sampling priority channels 1, 21, and 41, in that order. If it finds activity on channel 21 while 61 is monitored, then bam, you get to hear channel 21.

Finally, if there's activity on channel 1, then that overrules all the other priority channels and monitors it continuously until the transmission stops, at which point it returns to normal scan and priority sampling.

Kind of a long-winded way of saying, it's been done. But more of a description of exactly how Uniden Bearcats do it.

ML> is a dipole and what is a discone, what is the difference between them
ML> ?? And which one is better?

I'm doing this direct instead of in a public forum for a reason...
When you ask such a question in a public forum, you will get many
conflicting answers, leaving you not much better off than when you started.
In your case, your best course of action would be to get a book on antennas
(your library will have several). If there's no library near, call Grove
(1-800-438-8155) and ask for a catalog, ororder the ARRL Antenna Guide (BOK
87). It's $29.95US, and is the best antenna book out there. Another good
book is The Antenna Handbook by W. Clem Small (BOK 68), $12.95.
Getting and reading the book is a far better way to get the info you want,
and a *LOT* less confusing.
Free advice, and worth every penny!

==============================

Hello WUNners, in this extra edition of the WUN Newsletter, I'd like to
introduce you to the 'Brotherhood', a Russian related diplo network that
fits in both the 'Digital Review' and 'Numbers & Oddities' columns.

Chapter 1: The story so far (1979 - 1995)
Chapter 2: Examples of chatter, preambles and messages
Chapter 3: List of link-id's and Callsigns
Chapter 4: Frequency lists
```

(=- a huge THANK YOU goes to my fellow Brotherhood-monitors -=)
(-= Leif Dehio, Dave Batcho, Paul Scalzo and Don Schimmel -=)
(-= and to those who sent logs, comments & suggestions -=)
(=- Thanks for the input and your time guys -=)

>>>>>>>>>>>>>>>>>>> Chapter 1: The story so far <<<<<<<<<<<<<<<<<<<<<<<<

The first encounters in the USA with the 'Brotherhood' stations were in the late 70's when they still used high speed CW (ca 32 WPM). Most of the early CW stations (PSN, BPA, SPK, WNY, YBU) are still active today. 'ROL' however disappeared completely. In the mid 80's the RTTY transmissions started. The speed used was 50bd. Messages to YBU were the most common ones in those days. Also messages to PSN were monitored. The callup was slightly different from the system that is used nowadays:

VVV PSN PSN PSN 2/245 VVV PSN PSN 2/245
NW NW
NR 271 GR 135
+ 5L or 5F groups

Then sometime in the mid-1980's they changed to the 5 group preamble they use now. But the original link designator's were different then.

Callsign / Link-id

YBU 07386
SPK 06446
PSN 03861
KAC 00172
JMS 00484
GMN 05418
BPA 06373
WNY 01428
KRN 00484

Traffic has always been the same group of cipher systems including the substitution group at the end.

By the late 1980's they were being reported in most of the UTE publications. Don Schimmel reported them in one of the earliest issues of Monitoring Times as UNID and Bob Margolis reported them in Popular Communications.

The NDO link has always been a strange one. Not much activity. Only one schedule a week (on Wednesdays) and even that is not granted. The WFO / MIG link is the only known 2-way link in the Americas. Although it still operates somewhat clandestinely - minimum amt of chatter, etc. The station sending WFO is definitely the Cuban end (by propagation and bearings). The other end has been pin pointed in the New York City area, probably the Russian UN delegacy.

In the late 80's an European network of RTTY stations popped up, similar to a network that was active in the America's. Both networks are still very active today.

The master station in Europe was 'RCF'. Several frequency guides listed RCF as Ministry for Foreign Affairs in Moscow. After the disintegration of the USSR, the 'RCF' callsign disappeared. The new master station is as powerful as RCF was and one thing is for sure: this station is located in or very near Moscow as well. The station was DFed various times and every time Moscow appeared to be the source of the signal. It is very likely that RCF is still alive and kicking, but doesn't use its old callsign anymore.
Whether the master station or RCF really is / was MFA Moscow will probably remain a mystery. There are many other suggestions though varying from a shipping network to possible connections with TASS, KGB or GRU.
I stick to the theory that this is a diplo network. Whenever something hot is happening, like the Chechenya actions, the stations of the Brotherhood are making overtime, even on Sundays, while there are normally no transmissions on Sundays. The only station that is often heard on Sundays is BFR, which may indicate that it is possibly located in an Islamic country.

The master station transmits crypted messages (5-letter or 5-figure groups) to the other stations. There are fixed schedules for a couple of stations while others are reported less frequently. During the time that RCF was still in place they didn't need to have fixed schedules, as the traffic list system was being used. Now that this system is no longer in use, each link has one or two fixed skeds on an assigned frequency pair. This system is probably much safer, as the sender knows that the recipient received the message correctly.
The auto-broadcasts to a.o. KUL, VKX, RAU and RKD are probably just circular's or routine traffic sent to the specific networks (transmitted blind and therefore repeated throughout the day on a larger number of frequencies). It appears that almost all the callsigns that were on RCF's traffic list are still there.

So far we have found the following fixed two-way schedules for Europe:
-
- 08:25-08:30 ??? to DKR
- 08:35 ??? to RJA
- 08:45 WQL to VNB and vice versa
- 09:10 ??? to UXW
- 09:25 ??? to JUA
- 10:05-10:10 ??? to CAZ
- 11:15 KKK to KUA
- 13:20 ??? to DKR
- 14:30 RGA to BFR and vice versa
- 14:50 ??? to RPO
- 16:35 ??? to UDZ 21
- 16:50 ??? to JUA

The callups and messages can be divided into two groups: the most common for the America's and Europe goes as follows: ''4646464646464646 KUL KUL KUL KUL 1/226''. Note that 46's are transmitted instead of RY's, then the callsign of the recipient and the number of messages / number of 5-letter or 5-figure groups in this message.
The other one is yet only noted in Europe. The transmissions start with a selcal of 6-tones (the system is called Mazielka), followed by the callsign

of the recipient sent in CW, then into RTTY where the preamble is hand keyed while the other system has an automated preamble. The Mazielka callup is fairly new, it has been reported since mid 1994.
The Mazielka is a selcal system that is used by the master station to wake up a station outside the normal fixed sked. It is only used to catch the operators attention, not to start the equipment remotely (just like the selcal used in aircraft). The fact that they switch to CW after the Mazielka is a sure sign that the operator has to prepare the equipment before they can start the transmission. The use of non-error correcting RTTY systems makes it practically impossible to establish a link automatically. The Mazielka has never been heard during the normal schedule times, so probably the Mazielka is used when there are very urgent messages that cannot wait 'till the regular schedule time. It seems that there are specific channels for rush traffic as well.

I think that a couple of the callsigns are not in use by only one station, but that KUL, VKX, RAU and RKD are in fact the callsigns of networks. This could mean that the automated transmissions to KUL etc include messages for all stations in such a network. This does not necessarily mean that there is only one callsign for every station in a network. As far as we know every station has a callsign of its own. However, the master station seems to use more than one callsign. VNB, KKK and RGA, which are believed to be transmitting from the same location are most probably callsigns of the master station. It seems that the master receives a different callsign on each specific two-way link.

What did we find so far ?

We have found several clues about the preambles and QSL system. Let's take a closer look at the preambles. Each message starts with a preamble consisting of 5 groups, followed by the message itself. A typical preamble looks like this: 11177 00142 23687 05012 01109.

1st group: probably a message identifier, stating what kinda message it is, maybe also a priority code. 11144, 11166, 11177 and 11199 are the combinations heard so far. The most common are 11177 and 11199.
The latter is being used for QSL purposes.

2nd group: the link-identifier, each link has its own id, except for stations who have a two-way link, in that case both stations have the same link-id.

3rd group: the crypto-factor.

4th group: the first two digits are the date and the last three are the message number.

5th group: the first four digits represent the number of groups in the message + 1. The extra group is most likely the crypto-factor (3rd group of the preamble). The last digit is either a '1' or a '9'.

After the messages have been sent, the operators sometimes have a little chat. In the America's the conversations are in often poor English while on the European side often cyrillic is used and also German words are used.

As I mentioned earlier, there are also QSL messages. The original messages can be transmitted on other frequencies and even on other days then the day the QSL messages gets out. The first group of the preamble is always 11199. The messages always seem to start with 55555 followed by 77011, while the last groups represent the QSLed messages. A typical QSL preamble and message looks like this:

11199 00142 00000 18010 00069
55555 77011 00089 00090 00091

Five different cipher systems have been noted:

1) The 3rd group of the preamble is 00000 and the message consists of 5L groups.
2) The 3rd group of the preamble consists of random digits and the message consists of 5L groups.
3) The 3rd group of the preamble consists of random digits and the message consists of 5F groups and the last group is NOT 11111.
4) The 3rd group of the preamble is 00000 and the message consists of 5F groups and the last group is 11111.
5) The 3rd group of the preamble is 00000 and the message consists of 5F groups and the last group is NOT 11111.

The Brotherhood uses various RTTY modes, the most common is Baudot 75bd. Sometimes 50 or 100bd is used. They also use a Russian version of Piccolo, better know as Crowd36 or CIS Piccolo, Other, yet unknown, exotic modes are used as well. Then there is of course the Mazielka and CW is used as well, mostly for chatting and callups.

Who are the partners in this Brotherhood ? Well, it's all guesses of course. No-one steps forward and says 'he you guys, it's me you're looking for' :-) According to DF-research, the European master station must be located in the Moscow region, while the WFO / MIG link is a link between Cuba and the New York area, probably the Russian UN legation. Station GMN could be located in Mexico City.

In 'Soviet Signals Intelligence' by professor Desmond Ball, he listed Soviet Sigint Posts located in the Western Hemisphere. The sigint posts are in Mexico City, Washington 2x, New York City, San Francisco, Managua, San Jose, Buenos Aires, Montreal, Ottawa, Chicago and Lima.
So far, 13 transmission schedules have been noted for the Brotherhood in the America's. There are 12 listed sigint posts and 13 schedules, so if there is a connection between the schedules and the sigint posts, then there must be at least one more sigint post.
The European scene is a bit different; we have not yet determined where the out-stations are located. Most probably outside Russia and in the eastern part of the country.

Then there are the QSF messages: 1/1, 2/1, 3/1, 7/1, 8/1, 9/1 QSF3
The official meaning of the QSF-code is ''I have effected rescue and am

proceeding to base''. We can safely assume that the Brotherhood-QSF's have nothing to do with the official meaning of the code. Intensive monitoring of the stations revealed that QSF2 means a normal schedule, QSF4 means no schedule and QSF3 is yet unknown but could mean that an alternative schedule will be used. On the days that QSF1 had been indicated a QRU was sent.

There is a very significant feature to the 5-letter traffic. The last group of every message is a simple substitution which indicates the date the message was composed and the group count which is always 3 less than the group count shown in the preamble. The substitution is:

O I U Z T R E W A P
0 1 2 3 4 5 6 7 8 9

For example:

11177 00148 57477 26811 00609

QKANG XOBJZ ..... VEVXX UEORW

The last group translates to 26057 -- 26th of the month, 57 groups.

ETFNJX TKAGAS

On the American network the sequence 'ETFNJX TKAGAS' is frequently heard. It is always transmitted in sloppy FSK Morse for a couple of minutes and then the transmission stops or continues in RTTY. Because the sloppy way in which this message is keyed, it most probably should read 'E/NJX TKAGAS' but also E/NJX QAG AS is possible.
The station simply comes up without any callsign and begins broadcasting ETNJX TKAGAS over and over for a period of ca 10 minutes. On most occasions, approximately 30 minutes later, one of the regular stations comes up and sends normal traffic but out of the fixed schedule for that station. The 'ET' messages have never been observed on the regular daily scheduled frequencies. They are transmitted on the same frequencies as the QWK messages that are also on the air for the last 15 years. The QWK messages are sent several times a year on one of the regular schedules along with the regular traffic. For example, on Dec. 3, 1994, the following was at the beginning of BPA's regular schedule:

QWK QDG FM 5/12 TO NEXT QWK
FM 00.00 TO 13.00 QSW 10698/7684/13532
FM 13.00 TO 24.00 QSW 16224/13532/19612

Also on Dec. 3, 1995 the following was sent at the end of SPK's regular traffic:

QWK QDG FM 5/12 TO NEXT QWK
FM 00.00 TO 12.00 QSW 10183/7418/13227
FM 12.00 TO 24.00 QSW 19808/16144/13227

ET messages have been heard on every one of the daytime frequencies listed in the messages above. And these messages on these frequencies are almost always copied on a Saturday or a Sunday, but occasionally during the week

as recently as March 22, 1995. The QWK message then seems to say "During the times indicated I will use the following as _standby_ or _alert_ frequencies." Until February 1995, there were no reports of such a string on the European network.
Recently a sequence, very much like the American one, was heard and it was keyed in the same sloppy way. The sequence was slightly different from the American one. This one reads 'E/NJX TKAZAS'. The string was recorded and played back for -I guess- a million times by several monitors and fed into a couple of decoders. Although it was a tough one to write down, we are 100% certain that the string is correctly decoded.

Bloopers

A couple of years ago, right at the moment that the WFO callup should find place, a numbers tape came up. After a moment it was terminated and replaced by the WFO callup tape. On another occasion the WNY callup tape was replaced by a PSN tape. After a few repetitions of the '464646 PSN PSN' lines, the correct WNY callup tape was transmitted. This proves the theory that also the American network has a master station.

CW powerhouses

Although it is just an uneducated guess, I believe that the CW powerhouses that can be heard on numerous frequencies, belong to the same organization as the RTTY network. These stations transmit 5L or 5F groups and often use odd Q-codes. In several occasions a CW station transmitted at the same time as a RTTY station and was only a couple of kHz away. The signals were equal in strength and they faded at exactly the same moment.

>>>>>>>>>>>>>>> Chapter 2: Chatter, preambles and messages <<<<<<<<<<<<<<<

A typical preamble for a message on link 60069, followed by the message which consists of 52 5-letter groups. As you can see the 5th group of the preamble states that there are 53 groups in this message. That is because the last group of the preamble is actually the first group of the message.

43127 29860 05485 71573 97484 90177 47836 03396 22210 41105
30544 31327 24852 37874 23453 24504 52880 52852 11111

The master station in Moscow sends out messages to KUL, VKX and
several others at a fixed daily schedule. Note the '46' test slip
instead of 'RY'. 'KUL' is the callsign of the recipient, there are
3 messages with a total of 535 5-letter groups. (messages shortened)

The station that started my interest in this network was RCF.
I captured its signal for the first time in the early eighties.
Several frequency lists listed this station as MFA Moscow.
RCF often transmitted callup lists that are similar to the
traffic lists that many of you may know from coastal stations.
Note the significant difference between the callups in the above
listed examples and the RCF broadcasts below. RCF started their
messages with DE RCF, while the master station now only uses the
callsign of the recipient, not their own callsign !

A difference between the European and American networks is the lack of
chatter on the American side. Here in Europe we have occasional chatter
between the operators. In the America's this seldom happens. The words
'TIKAS' and 'SEE' are often used, mostly when the operators have a
'technical' chat. 'TIKAS' probably comes from Ticai or Tikat which means
'to tick' in various Slavic languages. So TIKAS probably means 'ticker'
or 'telex operator / telex / telegram / telex machine' or whatever. The
use of SEE in "OM AS SEE A UR PER?" indicates this translation as well
(see below for KUA traffic). In this case it would be used as "OM wait,
look at your perforator"

vnr 05 gr 314
nr 05 gr 314

tikas
for ptf kua -after qky qrz
zkuuuuuukkkkkkaeex
tikas
for ptf kua -after qky qrz

qru sk qru sk

-> TIKAS in this sense, probably refers to telegram traffic on hand
-> for 'PTF' and 'KUA'.

This was heard on the link 10163 on 16.008 kHz at 09:20 UTC 24/08/94

The following was heard on the KUA link. Note the last paragraph in
which the operator asks if he may use a Russian register to continue.
The RTTY message was sent in 'normal' shift while it is easier for
the operator to chat in 3rd shift Cyrillic, or what he calls 'Ruskih
registrow'.

QSL messages which always bear a 11199 as the first group in the preamble, and begin with 55555. Recently a startling message was sent by YBU. It seems to be the first un-enciphered code ever seen on the Brotherhood. Here is the entire message:

11199 00148 00000 20269 01759

55555 77011 99641 99749 99736 99719 99726 99667 99635 99749
99736 99710 99750 99736 99751 99762 99640 99607 99749 99736

99635 99655 44326 99607 99751 99698 99737 99639 99744 99750
99721 99688 99721 99641 99750 99744 99750 99641 99636 99744
99736 99711 99649 99736 99635 99696 99736 99656 99736 99635
99641 99736 99749 99750 99749 99736 99719 99756 99740 99736
99687 99736 99612 99721 99736 99705 99736 99678 99749 99677
99736 99612 99736 99649 99635 99696 99736 99683 99696 99696
99639 99696 99750 99681 99736 99656 99736 99765 99635 99639
99765 99721 99681 99655 99736 99612 99736 99649 99635 99641
99683 99750 99768 99639 99750 99636 99681 99749 99765 99749
99736 99724 99742 99736 99725 99640 99647 99751 99676 99775
99747 99601 99747 99749

Analysis shows that starting at the third group, this message uses a trinomial (3-digit) code. When sent as 5F groups, the first two digits of each 5F group are null's. All of the code groups begin with either a 6 or a 7 except for the one group (repeated three times in the message) which uses 44 as the null's.

What do you think of this chatter by NDO's operator:

"SULTAN BORN DOTHER (3500/54)" good example of bad English; I assume the 3500/54 is the weight and length in metric of the new born daughter.

It's quite simple,really. It matters not whether you are a police officer,
a firefighter, an emergency medical technician nor even an order taker at
Arbey's. Take to the airwaves and you WILL be scanned. Don't even bother
trying to hide. The scanners WILL find you. That is all......

Cross-posted to: rec.radio.swap,rec.radio.scanner

A 67 year-old called me other day looking for a Pro-2006. Sounded like he wanted to get his hands on one soon.

If you know have one for sale, or know where he can get one, please email me!

Thanks much!
-Mike Baranowski

When I worked in the Parking Lot at Disneyland, we would always pick up the local McDonalds drive-through on our tram radios. Especially if we were on the east side of the parking lot, nearest McDonalds. Our gas pumps are on the side near Micky D's and one boring night I tried to make contact, but never got a response.

"M-24 to McDonalds..."

If you're in the area, tune into 464.4875 for P-lot and McDonalds.
That's green channel.
White is good too. It's got the steamtrains and monorail. I was cross trained on steam trains too so It's another personal favorite. It's at 464.7625

So, what kind of equipment would one need to transmit on said fastfood freqs in CTCSS mode?

76. Re: How Do I Set off Radar Detectors???

Newsgroup: rec.radio.scanner
Date: 1995-04-02 00:00:00 UTC
From: xrbarron@fullerton.edu
Message-ID: <xrbarron-0204950150150001@dialin33641.slip.nts.uci.edu>
Source record: 259031

Somebody E-mailed me in response to my quesiton of the same nature and said that they picked up a surplus automatic door opening unit (like supermarket doors) that the use radar frequency of X band (10.525 GHz). He picked one or two up for $5. They were ment for 12VDC, but he said they are working up to a block away at 9VDC. I dusted off my radar detector (Spectrum 2) and tried it out by driving in front of some automatic doors. Within about 200' I was up to a 6 signal while driving at a right angle to the direction it was pointed. at about 100' I was up to 9 (out of 9) on the detector. It seemed to work with a number of different openers.

They seem to be attached with just a pivot screw and a small gague, insulated wire. That would be easy to mount in a car and hook up behind the grill. They should already be weatherproof. I suspect you can ignore any 'trigger' wire that it may have and just connect it to a ground source under the hood, then take a momentary switch of some type (or toggle for longer stints) and mount it in the dash with power going to the unit through the switch. Don't forget the in-line fuse. Standard precautions for avoiding RMF interference in your stereo/scanner.

77. Cascade Priority?

Newsgroup: rec.radio.scanner
Date: 1995-04-02 00:00:00 UTC
From: xrbarron@fullerton.edu
Message-ID: <xrbarron-0204950200320001@dialin33641.slip.nts.uci.edu>
Source record: 259032

I like my priority feature on my scanners. The only problem is that I only get one frequency to choose as priority. I'd like to see someone come out with a 'cascade priority' system, where you could assign a handfull of priority frequencies, but the priority frequencies have a pecking order, so to speak.

I like to listen to the local PD, but mor einteresting stuff happens on the PD emergency (red) channel. That has priority. But sometimes I'd like to hear the local fire department dispatches even more than the police emergency transmissions. So if all three have stuff going on, it would know that I want to listen to the local FD over the two PD frequencies, but drop back down to my second priority (red) if priority number one (FD) stops X-Miting, instead of just going back to scan mode.

Does this make sense? Does this exist in any scanner less than $300?

If you decide to put this in as a new feature in your next scanner Mr. Bearcat or Mr. Radio Shack, you can use my 'cascade priority' term if you wish. (I'm quite proud of it - thought it up all by myself). ;}

Interactive Systems Inc. in Arlington VA. has FCC data on an on line format.

Great menus and daily up to date info.

I've been using them for a few years now and they bill me at the end of the month.

I understand new accounts with them can be VISA/MC.

It's great for checking up on the latest filings.

>better?

>Thanks,
>Marley.

A discone is a kind of dipole. It is configured as one
element which is a disk and another which is a cone,
hence the name.

A simple dipole can be 2 pieces of wire, one attached to
each side of your feedline (co-ax).

The advantage of a discone is that it is resonant at a
wide range of frequencys.

The advantage of a simple dipole is that it can be
very cheap and simple. A simple dipole, cut for
50 MHZ, will probably perform satisfactorily at
900 MHZ for scanner use.

>Subject: Can Scout tune AR8k?
>Does anyone know if the scout will interface to an AR-8000?

Steve:

Unfortunately not (at this time).

Right now, the two use seperate interface and command specs. The AR8k uses its
own commands, while the Scout conforms to the ICOM commands. I guess if someone really wanted to, they could right a program to grab the information
from one COM port (via a CT-17 or CX-12 I/F) and tune the AR8k on another COM
port.

Who knows though, it sure would be nice if someone made a protocol adapter that
would allow the AR8K to hang off the CT-17 or CX-12 boxes and would tranlate
the (incoming) ICOM commands to the (outgoing) AR's commands.....hmmmmm

Never discharge a Ni-Cad below 1 volt. If you fear memory loss, simply
give the battery a simple 2000mike zap at each charge.

If you need to rejuvenate a stubborn ni-cad, use a 10,000 to 50,000 mike cap
and zap the little bugger about 5 times and then recharge in the normal way.

Incredible!

Didn't your agency have any mutual aid agreements? 154.280 IS the primary
mutual aid frequency for California Fire depts. I never known a dept. to
NOT have it, yours is a first. You didn't even have a scanner on board
that could monitor the frequency?

> bolts and you will see some discount 10Ghz microwave for video.

"Thank you for sending the above" (a generic courtesy response).

I'm sorry to have to respond to your email with a form letter, but the incredible rush of "clueless newbies" on the net has forced me to do this as a survival tactic.

It would have been much more appropriate to mail the above letter information to the person who ASKED the question; rather than to me, who ANSWERED it.

Please read an article thoroughly before hitting the "r" key. You might sometimes notice that it contains a RESPONSE to the original question, rather than containing just the question. A good clue to this situation is that the text containing the question itself has a "quote" character preceding each line (often a greater than sign, as in the quote of your message above).

The author of such an article is probably not an appropriate person to send a reply to, since they KNOW the answer (or, at least, think they do).

Of course, if you believe they are incorrect in their response, that is another story. However, your message did not indicate you were writing me to correct my response.

Perhaps you'd like to go back and find the original article which posed the question, and mail the response above to its author.

If you are new at this, I strongly urge you to take some time to learn about the structure of articles including attributions, headers, and threading BEFORE you blindly send an email response to anyone else.

regards -- mike

Judge for yourself what kind of fellow this is.

Hi:

I'm looking for a basic database program for my Frequencys.
I want to enter them into this database with just :
a...frequency (xxxx.xxx mhz)
b...discription (new york police dept)

When i get all the freqs into the database i want to be able to :
a...veiw and print all data numerically or from A to Z.
b...view and print all data between 2 inputted freq's.
c...view and print certain freq's (ex. all the a's, b's, etc)

I'm not sure if such a program exists, but could someone let me know
either way.

If someone has such a program, could you please send a copy via e-mail.

Thanks in advance...

Radio Shack PRO-43 Modifications FAQ
CONTENTS

1. Introduction
2. Which units can be modified for extended frequency
reception?
3. Companies that will modify the PRO-43 for extended
frequency reception
4. The modifications
extended receive (original mod + solderless)
keypad beep delete
improved audio
attaching an S-meter
400 memory channels

---

1. Introduction

Because there is a continuing demand for it, this mini-FAQ about PRO-43 modifications will be posted every two weeks until there is demand for its removal. In large part, it is the file PRO43.MOD from pub/hamradio/mods/tandy at oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter

There is also a mod for 400 memory channels, but, to quote its author, it is very complicated, should only be attempted by someone with moderate to advanced electronics experience, and is not for the faint of heart or the "weekend technician." A brief description is included at the end of this FAQ. If the mod were included in its entirety, the size of the FAQ would be increased four-fold.

---

2. Which units can be modified for extended frequency reception?

Note: In the United States, it is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment that can receive or can be

modified to receive such communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive? Units sold in the US and Canada can be identified by the following scheme

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994). [There have been *no* reports of a modifiable 3A4 unit.]

It has been reported that some units currently being made for sale overseas can be modified for extended 800 MHz reception. However, it is not known whether this applies to all overseas units or, if not, whether there is a way to distinguish modifiable units from nonmodifiable units.

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a changeover or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the extended receive modification is worthwhile. According to Bob Parnass, from his "Improved Audio Mod", below:

"Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it. On the other hand, quoting ray_reese@tscnet.eskimo.com (Ray Reese),

When I purchased my PRO-43 and did the mod for adding 54-88 Mhz, using the removed cell. diode, I wanted to be able to listen to the sound carrier for the tv channels 2-6 as well as the 72-76 Mhz band. It is worth the trouble to make the mode and it does work well in my area, despite not having the correct coils for that band area. Do the mod anyway, but [if you've trashed your original diode], use a 1N4148 fast-switching diode. Perhaps a 1N914 might do the job also. They can be found at Radio Shack for a cheap price.

---

3. Companies that will modify the PRO-43 for extended frequency reception

If you'd rather not do the modification for extended frequency reception yourself, Cellular Security Group, 106 Western Avenue, Essex, MA 01929 (508/768-7486) will do it for $40, which includes insured UPS return postage. However, CSG will not move the diode to extend the low band to 88 MHz; they only remove the diode to unlock the 800 MHz frequencies. When CSG is mentioned on the net, two types of comments follow: testimonials from satisfied customers and comments from those with the technical skills claiming that the service seems high priced for just removing the diode. But, there have been *no* reports of shoddy work or damaged radios. (They've modified two of mine.) Units are processed within 24 hours of receipt.

Grove Enterprises' newly advertised Repair Service will perform the mod for $40 plus shipping. They will move (rather than just remove) the diode in units that can benefit from it, but state that there is no way to tell whether the diode should be moved without looking inside. They claim that the determination can not be made from the serial number, FCC-ID, or date of manufacture. For further details, call Grove at 704/837-7081. In order to get a unit modified, a service order number must be obtained from the same telephone number. Packages without a SO# will be refused.

---
4. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them. They are selling the PRO-43 for $300 which is $50 less than Radio Shack. I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

From: IN%"savage@dg-rtp.dg.com" 2-FEB-1995 17:55:07.31

BTW, I did something similar [to the mod that follows] but MUCH
easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the
batteries usually lie. You'll see the diodes there. Simply take an
xacto knife and and break the solder on the D4 diode (left-most on
mine) on the side facing you. I just cut back-and-forth for a bit.
Once the solder (it's surface mounted) is weak enough, I just bend up
the diode a bit from the PCB. Presto. I left mine hanging on the one
side with solder. If you continue to work it a bit, you can probably
remove the whole diode.

--Ed

From: springel@umich.edu (Jason G. Springel)
Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading
many of the praises for the Pro-43 on this newsgroup. I decided to try
and MOD it, but don't have a lot of experience with a soldering iron.
After examining the scanner's innards, I found it was quite easy to
"fix" with nothing more than a minature philips screwdriver and some
small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of
microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and
other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by
four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit), remove the two screws from the lower circuit board. Looking down at the unit, you will see that the screw on right side of the lower circuit board can be easily removed. Remove the screw on the left side by by sliding the screwdriver between the top circuit board and the metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel (antenna, volume, and squelch knobs) along with the top two circuit boards as one unit. The two circuit boards will be connected to the final circuit board (the one attached to the front section of the scanner) by several wires. Simply set the top panel/circuit boards alongside the front section of the scanner and you can leave these wires connected.

Step 5

The microporcessor is located under the large metal shield on the final board (the front section of the scanner with the display and keypad). If you look under metal shield from the side closest to the bottom of the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to remove it completely (unless you want to use it to restore additional frequencies as explained in other MODs), you can just lift one side so it dosen't make connection and then put a small piece of tape or heat shrink over it, so it won't. Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD!
Hope this helps those of you who do not own a soldering iron!

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European
version of the PRO-43 has different coils and capaci-
tors in the low (mid) band front end filter. That
explains why the 75 MHz sensitivity isn't stellar after
adding diode D3 to enable 30-88 MHz coverage.

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the
PRO-43! Only a simple circuit and your choice of meter, analog or LED, is
required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom
(solder side) of the AF Board (middle board). You will need the Service
Manual for the PRO-43 to find it as it's not marked and it would take me
10,000 words to guide you to exactly where it is located. Call Tandy National
Parts at (800) 442-2425 to order your manual: approx $10. Now here is the
deal:

Locate D-302 and either build the following circuit right there on the back of
the AF board in the vicinity of D-302, or solder a wire to the cathode of
D-302 and route it to somewhere else more convenient to feed the below
circuit. This wire ought not to be very long, though, say not more than a
couple of inches. Refer to the ASCII schematic diagram as follows:

PRO-43
PRO-43 D-302 existing
T-302 x---o--|<-------x PRO-43 ckt
/ |
Connect |
here | 0.01-uF 1N34A
|------||------o-------->|----o---o-----------> (+)

```
| | |
| \ | To the
| 47-k / | S-Meter of
| ohms \ = 0.01-uF Your Choice
| / | (This should
| 1N34A | | be a jack
|-----|<-------o---o----------> (-) mounted on
^ PRO-43 Ground^ the case of
Legend: the scanner.
|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|

2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode

3. o means a connection, preferably soldered

4. The 47-k resistor is self-explanatory, I hope.

5. -------- and | are wires/conductors.
|
|

6. x is existing PRO-43 circuitry
```

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

```
5-k Trim Pot
(+) --------/\/\/\/\---o--------|
| | |
This should |-------| |
be a plug of +
some sort to The S-Meter
connect to the Terminals
mating jack on -
the scanner |
|
(-)-----------------------------|
```

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal

strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit

board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

Emitting bogus rf transmissions is a fundamentally sick idea.

As a sailor, I hope it won't occur to you next that it would be
"cute" to transmit bogus "Maydays", just to see what happens....

Uh, that's assuming, or course, that radar and radar detectors are
intended to be used for emergencies. Radar detectors have only one purpose - to
thwart enforcement of speed limits. More than half of the people I've seen with
radar detectors drive above the safe speed for given road and traffic
conditions, and often drive recklessly. They do not use them for safety or
emergency reasons. Kerchunking in the microwave band *is* **not**, by any
stretch of the imagination, the same as sending out a bogus SOS.
Pete.

Matt;

The ANT-8 will improve reception on the scout, but it will also increase
the chances of receiving too many strong signals at once. This can
decrease the chances of getting a usable readout.

Electronic Rainbow sells a microwave transmitter that sets off radar
detectors. It is about the size of a pack of cigarettes. The range is
about 1/2 a mile. Runs on a 9 volt battery. I have a blast with mine
on long trips. By some federal reg, semi-trucks are not allowed to
have radar detectors anymore, but a few will hit the brakes when I
push the button. Electronic Rainbow's phone # is: (317) 291-7262.
They will have several booths at Dayton this year. Give them a call.

OptoScan only goes inside the pro-2006, and contains a serial connector.
The slot used in the PC is your SERIAL/PARALLEL card, which you should
already have if you use a printer, mouse, or modem etc.., unless you have
a PS/2 or Dell which has built in serial port.

I stopped a woman one time who insisted I was lying about her speed, even though I had a stationary RADAR reading and a good pace of her doing +15 over the limit before stopping her. She stated that I was lying about using a RADAR unit even when I pointed out the HR-12 on the dash. She insisted it wasn't working as her RADAR detector never went off. I let her vent for a short time then pointed out that her RADAR detector wasn't working. She yanked on the cord and found that it wasn't plugged into the cigarette lighter. The verbal barrage stopped and she signed the ticket; however, she was not a happy customer. She challenged the ticket in court and the judge and prosecutor got a chuckle over it when I related about the RADAR detector problem. Her entire defense was I refused to show her the RADAR unit, even though I had offered to let her see the target reading (which is not required in my state, but I have learned can stop a lot of arguments). She was found guilty.

I disagree. The radar detector is a device people use not to save their
lives in an emergency, but instead to endanger their own and others' lives
for entertainment. Excessive speeding is not only inefficient, it is also
dangerous - many fatal crashes occur due to reckless, speeding drivers.

Also, a radar detector does not just detect police radar - it actually
monitors signals at certain frequencies, most notably the x and k bands.
Note that automatic door openers also emit similar transmissions, which can
trigger radar detectors. These are not 'bogus rf transmissions.' They are
just transmissions that happen to occur in the x band.

The fact is that speeders who do not want tickets learn to rely on
their radar detectors. Light is green, go as fast as you want. Light turns
red, slow down. These speeders are Pavlovian subjects, trained to vary
their speed out of fear of punishment rather than fear of accident or death.

For those of us who believe that some laws are valid tools in protecting
life and property, we can use this dependency to create safer highways.
Using a x band transmitter specifically for the purpose of setting off radar
detectors encourages veteran speeders to slow down and drive carefully. Or
do you want people to get killed in car accidents?

The only caveat is that these transmitters are dangerous if they interfere with law enforcement's use of radar speed determination. Then, speeders who do not care about getting tickets may be protected from legal punishment.

This is not about people announcing 'bogus maydays.' It is about law-abiding citizens quietly encouraging legal behavior. Perhaps you would rather shoot out speeders' tires to make them slow down. I would rather stop an accident than create one.

end flame.

Sincerely,

Jason T. Amdor, KB0AZI

This is the only topic on our local bbs that may assist me, please
direct me to another forum if I need to.
My father in law just gave me a 1950's Zenith trans oceanic portable
shortwave radio. It is a box about a foot and a half long, one foot
high and 8 inches wide. It has a 'Wavemagnet' antenna which is really
odd. The bands are from 31M to 520 on the am dial.
The thing works great, but I can't get the wavemagnet antenna to
release.
Who could tell me what this radio is worth?
thanks, mike pelletier, peletier@busstop.com in N.H.

Gee-

There is a difference between correcting/educating people and flaming them
or classifing them as idiots as you have.

Everbody is new at everything at some point in their lives. Have you NEVER
done anything wrong in your life or even simply hit a wrong key on the
keyboard ?

(Shit, I hit the wrong key [F instead of D] on the microvax that controls
our companie's Access Control system. The card readers for 35 Apple
Computer buildings card readers went down at 17:00 for 2 hours, thank god
EVERYONE that called to complain, cut me slack when I explained the error)

Hasn't anybody ever cut you any slack, or took the time to help you out
and explain things you so you don't make the same embarrassing mistake?

Jeez, lighten up, don't be so dam judgemental, one day you might need a
hand, I hope people around you, aren't like you. I can see it now, your
tire blows out, you swerve and wreck your car. There you are, sitting
inside pinned unconcious, "hey I recognize the guy, he's Mike Schuster,
that dickhead that never cuts anybody any slack", hummmmm........

: AR> Are you *sure* it's unlawful? I recall that it is now confidential and
: AR> no longer admissable as evidence without a court ordered wire tap, but
: AR> that's not the same thing.

: Yup, it's illegal. The ECPA has been changed to remove the exemption for
: cordless phones.
: This is for the U.S. only.
: Sort of like, standing up in a crowded restaurant and saying,"We will be
: having a private conversation at this table, so don't listen!" The whole
: restaurant will go silent, trying to hear what's being said at that table.

A better example - "standing up in a crowded restaurant of law enforcement officers and saying 'We will be having a private conversation at this table, anyone caught listening will be duly sentenced under law' and seeing how many arrests (don't) take place."

Heck, they can't and won't enforce it. No one need abide by it. I don't agree with it, so let the law go to h*ll, it's not stopping me!

I have a couple of surplus dual-tech (PIR/microwave) motion sensors that
I'd like to use to "test" radar detectors with :-). By powering them with
the specified 12VDC, walking around the room, and watching the indicator
lights they both seem to function.

The horns are self-contained cast metal assemblies having a cavity with
an electrical part (Gunn plexor diode?) stretched across them. One
terminal protrudes through the casing and is connected to wire having
a positive voltage. There are small screw adjustments, I assume to be
used a fine tuners, that are glued in place and intact.

Both seem to have a pot used for microwave sensitivity adjustment.

My questions:

1. Although both microwave emitters are marked 10.525 GHZ, they
don't register on a working radar detector at any distance at any
setting of the pot mentioned above. Why?

2. How do I get the intact unit to trigger a radar detector?

3. What parts do I remove, and how do I wire them, to use the horn assembly
separately?

I agree with your reply but check this out. I just purchased an RCA
(Thomson Consumer Electronics) Camcorder. Their charging instructions
say "the [NiCd] battery will provide increased operation time if you
refresh it after five charges. The REFRESH feature refreshes the
battery by completely discharging it." There is a "REFRESH" switch
on the charger for discharging the battery.

Is RCA perpetuating the NiCd memory myth? Why would they say this?

Also, I bought a third-party spare NiCd battery from Direct Power Plus.
They say "always full discharge the battery before recharging." Why
do they say this?

On another note, Direct Power Plus says "your battery should accept
more than 1,000 recharge cycles." Has anyone *ever* got 1,000
recharge cycles out of a NiCd battery? I'm pretty confident that I
have not.

If it has 800 it will have the new 900 cordless although most 900
cordless is scrambled or digital. As far as cellular, all of the new
ones omit the 869-894 cell band. If you get a cheap double conversion
model, you can still hear cellular images above or below this band.

Is it possible to recharge the Ni-Cd battery using the low voltage than
the specified one? I am trying to recharge 10.8 V/ 450 mAH HT battery
with the 3V/ 1 Amp AC adapter. I am assuming that the Ni-Cd is charged
by the electrons supplied by the adaptor and it might take a longer time
than let's say 12 V. Is there any harm doing that?
Thanks for the consideration. Please post or reply.
Bishwa Shrestha, KC7JFV

In response to the recent debate here on setting off radar detectors
that I posted, I just wanted to set a few things straight.

1. How does sending bogus SOS transmissions relate to setting off a
radar detector? As many before me have stated..IT HAS NOTHING AT
ALL TO DO WITH IT. Where did you pull that one from?

2. I'm not going to sit here and claim that I wanted to slow somebody
down using it on the thruway or the Mass Pike..BUT, everyone has
had someone go blasting by them once or twice on the highway, and
thought--"Hey, wouldn't that be fun to give him a little fear?"

Thanks to everyone who sent me Email and also posted info here about it..
I certaintly don't want to start some debate here (Like Rec.auto.driving)
but I did need some info. It does crack me up that 800 meg cell phones
modifications are discussed here routinely without anyone saying anything,
then I post something about radar detectors, and I get the wrath of the
internet. (Oh yeah, some people decided to send Nasty Email to me about
it....Quiet night for them I guess).
(All my scanners have the cell mod done too..)

Scott

PS--Oh yeah, I did get one..and the first place I'm using it is on the
911 ambulance company I work at as an EMT--Fun, fun, fun on the express
way!

Hi, one more (I hope) Scout antenna whip kinda question...

Whips will still work when their not extended out to their full length,
right?
For instance, when I want to do some walk-by stuff with my scout and have
a whip on it, it'll still work if it's extended to 7", right?

Oh yeah...
Does anybody know of one particular antenna that works good with the Scout
(or any other freq counter) on most bands? If so, where can I get it...
Right now I'm using the rubber duck that comes with Radio Shack's PRO-39,
and it seems to be working pretty good...

Thanks,

If the halogen lamp supply is utilising a diode as a dimmer (Conduction for only one-half a cycle, hence half the average power from the 50/60 Hz AC mains), I would speculate that diode is generating plenty of harmonics due to some abrupt-conduction curve... what's the solution to suppressing the RF generation? Bypassing the diode with a resistor and or capacitor? If so, what values? RF chokes in series with the diode? Capacitors of small value that would short the RF to ground? Big RF beads?

The latest "QST" magazine also mentions the susceptibility of so-called "Touch Switches" to RFI from amateur radio transmitters, so perhaps Hams could convince recalcitrent "Touch Switch" owners the error of their ways... :-)

You sure it is working?? I bought one and it will work for about 4
times before it poops out. Not to mention the fact that it takes about
4 seconds before enough power is built up up to produce a
signal. Doesnt really work as an instant zapper, unless you considr
your finger on the button for 5 minutes instant. All in all it was
$50 wasted. I might have gotten a dud, but i would make sure that yo
get some more opinions from people who have radr detectors to verify
that these are working.

PS:) I have a Valentine detector that I know works.

A radar detector that ignored the X-band wouldn't be of much use in the
real world. In this age of tight municipal budgets, there are plenty of
older X-band radar units still in daily service. Most people having radar
detectors which give separate alerts for each band know that - most of the
K and Ka alerts are false alarms in many areas :-)

The only law that Im aware of in New York State in regards to scanning is the one having to do with scanners in cars. Unless you have a Ham license you are not allowed to have a scanner in your car. Now thats the law. Of course if your a fire fighter, EMT etc. and get stopped and the cops see the scanner chances are they wont bother you. It reall depends on the cop. If you have more question E-mail me.

Bundy, (and all those interested in Federal Frequencies and 'Codes')
I highly recommend getting a copy of the fourth edition of "Federal
Government Frequency Assignments" published by Artsci Publishing! I
have just about every 'federal book' avaliable and I consider this one
to the THE authority!

After looking in the book I think people are confusing "CROWN" and "ROYAL
CROWN". The book lists "CROWN" as "THE WHITE HOUSE" and "ROYAL CROWN" as
"WHCA [White House Communications Agency] SECURE VOICE SYSTEM". This
sounds exactly like what the original poster was describing regarding
the handshaking, etc.

BTW, I ordered my book from COMSEC at 800-990-0911. I do not remember the
exact price, but it's rather inexpensive. Also, COMSEC's staff was very
helpful and the book arrived promptly (no I am not an employee of the
company, or get any part of the profits :-)

What does it take to get an Ameteur Radio Operators License? Will a
codeless exam like the one that Radio Shack has a book for work? How much
will it cost?

So far I've only heard that they don't interfer with police radar from
people knowledgeable to have such discussions in technical detail. I guess
its the same type of situation that occurs when two police cars drive past
each other with radar guns on. Nothing unusual happens. Perhaps someone
with more knowledge can put in a few comments one way or the other (all
conjecture aside).

>shortwave bands! (RZ-1 has coverage from .5 to 905 MHz)....
>

I've mounted a PRO2026 in my 4Runner plus mounted a Kenwood RZ-1 in my
old Supra. I've used a glass-mount Larson 440 MHz antenna plus use the stock
AM/FM antenna in the car for reception.

Using my ICOM R7100's S-meter and performing A/B comparison testing,
my testing shows that the AM/FM antenna tops out at 150 MHz--above that, the
Larson 440 MHz glassmount antenna works better. Properly installed, the

glassmount antenna works quite well. The coax cable from the
AM/FM antenna is designed to work with the AM and FM broadcast bands,
and not much higher. To maximize my performance, I use a ham radio
2M/440 MHz duplexer to combine the two antennas together--the low pass
port connects to the AM/FM antenna, and the highpass port connects to
the 440 MHz antenna. That way I get the longer antenna performance where
I need it, and the lower cable/antenna loss performance up where it works best.

Like Eddie mentioned above, the PRO2026 is smaller than DIN in height and width,
so I had to make a black plastic trim piece to fill in the gap around the scanner.
However the PRO2026 is a pretty deep radio, and being that the 4Runner's
DIN bays are not really deep, the scanner sticks out some--but then again,
so does the Alpine stereo I have mounted above it.

The only problem I've been having is that my PRO2026 has a severe intermod
problem where all combinations of incoming signals who differ by the PRO2026's
IFcomes through loud and clear. I don't know if I have a defective scanner,
or if it's an inherent trait of this scanner--the front end is hardly as sophisticated
as some of the other scanners I have. To try to counteract this, I've put an
adjustable attenuator in. This helps some, but, of course, it also nukes the
signals I *DO* want to hear.

143. What range to expect from ATT 9100 900 MHz cordless phone?

Newsgroup: rec.radio.scanner
Date: 1995-04-03 00:00:00 UTC
From: bezenek@plains.NoDak.edu
Message-ID: <D6FoCy.HoL@ns1.nodak.edu>
Source record: 258983
Cross-posted to: sci.electronics,rec.radio.amateur.misc,rec.radio.scanner

I just bought an ATT 9100 (same as 9120, but without an intercom)
cordless phone. It is a 900 MHz model, with digitized sound.

I am only getting about 200 feet of range before I start getting
drop-outs, whether the path is line-of-sight or not. That is good,
because obsticals do not seem to matter, but I expected a little bit
better for line-of-site.

The manual does say that the phone is designed to be at the legal power
limit on 900 MHz. I assume that the limit is pretty small...

Should I be getting more than 200 ft? If not, has anyone done any mods
(elevated antenna on base, etc.) to get better range?

Thank you in advance,

Todd

If I understand correctly what you propose, that's the same multi-level
priority sampling algorithm found in most Uniden/Bearcat models,
dating back to the portable BC100XLT. It is used in the newest
BC3000XLT and BC9000XLT, too.

Good idea, though.

Greetings,

This is what I need:

A scanner that will enable me to EFFICIENTLY monitor a mobile cell phone. I need to have the ability to effectively monitor a conversation with GOOD reception. I also will need to record the conversation.

Money is not really an issue. The quality of the equipment is the priority here. What kind of equipment should I look for?

Again, I need to have good, reliable reception of a mobile mounted cell phone with recording capabilities. Also, is it possible to get the number that is being dialed FROM the cell phone?

Please E-Mail me.

Thanks in advance.....

147. Re: Ever hear trunked radio conversations?

Newsgroup: rec.radio.scanner
Date: 1995-04-03 00:00:00 UTC
From: dg715@cleveland.Freenet.Edu
Message-ID: <3lo2he$osg@usenet.INS.CWRU.Edu>
Source record: 258987

The basic premise behind trunked radio systems is somewhat simple, but it's not a simple thing to explain.

The reason for trunking is to let more agencies share a limited number of frequencies. Small trunked systems can have just a few frequencies, possibly 3-5, while larger systems can have dozens of frequencies.

Suppose your PD shares a trunked system with five other departments, and your system has 10 frequencies. A central computer constantly monitors those frequencies. When one of your radios keys up, it emits an inaudible tone that tells the computer which department's radio is keying. The computer then takes the signal and transmits it on one of the 10 frequencies that isn't in use at the moment. At the same time, an inaudible signal is transmitted that tells all radios from that same department to tune to the frequency in use and receive the signal. All this happens in milliseconds.

If a response to the first broadcast comes before the radio system's repeater unit has released the frequency (usually 1-2 seconds after the transmitting radio ceases transmitting), the response will come on the same frequency. If, however, the repeater has released the frequency, the whole operation begins all over as soon as the responding radio is keyed.

How does this make better use of the spectrum? If 5 departments are sharing one frequency, only one department can speak at any given time. If 5 departments (or more) are sharing 10 frequencies and the equipment itself is capable of immediately finding a clear channel, all of the departments can carry out their communications simultaneously. If the radios are coded to recognize other agencies' transmissions on the trunked system, the agencies can also talk to each other although, in normal use, the agencies won't hear each other's communications.

I hope this answers your question...or at least makes a little bit of sense.

BTW, trunking is not something that can only take place on 800mhz. The technology can be applied to any band.

>and zap the little bugger about 5 times and then recharge in the normal way.

Gary, zapping a NiCad can sometimes burn off a dendrite that is shorting a cell, but it won't do anything for voltage depression (aka memory effect). The best thing to do about voltage depression is to avoid it. You can do this by *not* discharging the battery to the same point each time, and by *not* excessively overcharging the battery. If you do get a voltage depression effect *and* you can access the individual cells in the pack, then discharging each cell *individually* to zero volts, and then giving a full slow charge to the cells, will "erase" the "memory". This will reduce the life of the battery, so it shouldn't be a routine practice.

The best way to deal with "memory" is to not cause it in the first place. Make it a practice to vary when you change and recharge packs on your radio. Don't always run it all the way down, and don't always change it after a fixed number of hours of use. Try to recharge the battery when it is in some random state of charge, and use a charger that will detect the "droop" when the battery *just* reaches full charge and *stops* charging at that point.

Gary

Per the Ramsey radar gun manual, the motion detector runs at 900+ MHz.

>
>By the way, Ramsey also has a radar gun kit for speed detection. You
>supply a couple coffee cans for the waveguide/horn. Again, I have
>no idea how well it works, but it sounds interesting.

This kit runs at 2.5 GHz. A spectrum analyzer showed mine at 2.545 GHz (and drifting!)

It works quite well--once you go back and fix up all the designed-in deficiencies of the kit.
(take out the noisy connectors, bypass the IC's in the audio frequency counter,
seal up the microwave horn tight tight tight, use a crystal earphone to prevent circuit oscillation).

They claim a 1/4 mile range--which is probably true if the target is a semi.

But if you want to trigger radar detectors with either of the two kits
mention above, you're going to be waaaaay too low in frequency.

On with the chase!

Are all PRO-43's sold outside the US and Canada
restorable? If some are not, does RS use the same scheme with the
serial numbers (prefixing the nonrestorable units with an A)? That is,
has anyone seen a nonrestorable unit from *anywhere* that did not have
an 'A' in front of its serial number?

Is GRE still manufacturing 43's for sale outside of the US or are we merely
watching an existing supply dwindle worldwide?

Sorry for the many questions. I'm just trying to keep the FAQ
up-to-date!

Ah...but the s/nos on the ones we have don't have an "A" at the
beginning, end or anywhere else, just xxxxxx :-(In fact the PRO-44's &
PRO-46's we have seen recently begin with Cxxxxxx indicating they are
sourced from a Chinese manufacturing plant, wonder if they are the same
in the US ?

You could perhaps go by the RS catalogue number though. I beleive the US
models are 20-xxx on most scanners. Most of European versions
are 20-9xxx. The PRO-43 is 20-300 with you, over here 20-9300. Likewise
the PRO-2006 was 20-145 - with us 20-9145.

All the best

From: abrant@ARL.MIL
Message-ID: <9504031223.aa18971@TBD2.ARL.MIL>
Source record: 259005

Hi all,

I just got a BC-100XLT scanner and want to do some mods.
The first one I would like to do is to the scanning speed,
in the mod file it said I will need a small crystal or
ceramic resonator in the 600-800 kHz range. Does anyone
have a source or part number for this item?
My next question is on fixing the low battery problem I
have, there seem to be 4 different fixes. Which one is best:

1. replace a diode and resistor (values are given in the mod file)
2. put a jumper across the diode
3. put a 6.8K resistor across the diode
4. remove the resistor and diode

I guess I will have to increase the mem. to 200 also:)

Thanks,
Andy <abrant@arl.mil>

I'm about a mile from the transmitter for a local radio station.
I've been getting a lot of interference on my scanner. If I turn
up the squelch it's not so bad, but I'm probably missing a lot too.
Are there any filters I can get for this? I also hear the radio
station on my phones and a handheld CB. Should I complain to the FCC?

Listen to 44.74 Mhz, that's where all the Trooper choppers get dispatched
(Trooper 1, etc). The dispatch will assign the active frequency to the
medivac while enroute, and is usually the local PD or FD frequency.

They are called "Zappers" and are (or were) available from a company called Transel in Ohio for about $50. I'm not positive of the company name but I can find out for sure.

I have had one of these for about a year. It is grand entertainment! It puts out 10mw @ 10.25 GHz. It falls through the FCC cracks as a "test/communication" device, and be warned, be prepared to show an ham radio liscense to the officer who has pulled you over to inquire about the radar noise coming from your car.

Trolling for tailights, what a game.

>yourself versions).

Most Radar Detector users IGNORE X-band alerts, since the cops rarely use X band anymore. The detectors are able to differentiate easily between the three bands - so you'll be wasting your money.

Also, many of the cars you'll see zapping by you are either cops or related to cops, or know a cop, so they wouldn't get stuck with a ticket anyway - and hence won't have Radar Detectors.

I would also doubt the FCC would licence these boxes, since they could interfere with licenced X-band devices, such as police radar. The cops may even think you are attempting to interfere with their radar, and do you for obstruction. You sound like a bit of a weasel, so maybe that would be sweet justice!

bring myself to sell the Yupi for that reason.

You might try one of the replacement antennas for the Radio Shack CBs.
One of them is a TNC mount, which you can buy a TNC/BNC adapter for.
It works GREAT on CB freqs and fairly good on lower HF freqs.

These are still available but they do 'legally' require an Amateur
Radio Operator's License to broadcast in that frequency range according to the
documentation that comes with the 'Zapper'. I saw one of these at the Atlanta,
GA Hamfest last year. Neat idea.

>: seen better for this or similar radios?
>:
>: Thanks.

Seems that lately Grove Enterprises will sell you one of the Standard US Cell Blocked models for around $600.

If you want one of the unblocked models, I wound up paying about $850 including shipping from Atlantic HAM radio in Canada.....
Javiation in the UK is a little cheaper but I am not sure of the price.

If ya wanna play ya gotta pay.............But the song remains the same.

187. For sale: ICOM R1

you'll probably never find a 1/4 wave marine mobile antenna. why?...
1/4 waves require a ground plane, not easy to do on a fiberglass boat.
therefore 1/2 wave whips are ideal (no ground plane needed). try 37"
plus or minus 1/2 an inch.

From: atkins@oeonline.com
Message-ID: <D6Ho5G.EBE@oeonline.com>
Source record: 258908

Hi all,

I am looking into getting the best possible scanner antenna for under $150.
In the FAQ, the Antenna Specialists AV-801 is mentioned, but I have been told
that this does not pick-up the 800Mhz frequencies. One of the Channel Master
antennas was also mentioned, but a salesman who is *really* into scanning told
me that they are rather cheaply made. He recommended one by a company called
Diamond...
Is what he says true?

How does the Diamond compare to other antennas? (I listen to everything from
29Mhz up to 990Mhz)

What other antennas should I be considering?

(Not to start a flame war, but...) What is the absolute best scanner antenna
that will cover all these freqencies?

What is the best one for under $150 that will cover all these frequencies?

Any and all help would be appreciated. I've only been scanning about 6
months, but enjoy it alot, and I want to get the best equipment possible for
my money (the first time).

Thanks,
- Rusty Atkins

Well, not quite. Coast Guard owned vehicles have VHF marine band radios.
That's how we communicated with our Commanding Officer at the Monterey
CG Station, and with our pollution response vehicle, and our
navigational aid repair vehicle. Marine channel 23 is the CG unit to
CG unit frequency.

Tony, A good place to start is to go to a newstand and buy a copy of
"Popular Communications" magazine. It's full of vendors of scanner,
shortwave and amatuer radio equipment, etc. Also, informative articles on
the hobby. Might be a little difficult to find, so be persistent.

Call 1-800-438-8155 for Grove Enterprises. They will send you one of their
catalogs. Reputable firm; excellent repair services also. Owned and
operated by enthusiasts of the hobby. They also publish "Monitoring Times"
magazine and will be happy to sign you up ....

Enjoy the hobby, and Happy Monitoring

200. Re: Digital information prece

Newsgroup: rec.radio.scanner
Date: 1995-04-04 00:00:00 UTC
From: robert@eden.com
Message-ID: <3lrdvi$g83@boris.eden.com>
Source record: 258913

In Austin TX the police radios transmit ANI (Automatic Number Identification) when they key up. sometimes on the scanner it sounds like some fast touch-tones. A typical Id would be a 4 digit number such as 5181.

That Id will show on a display at dispatch. and will remain on the display until the next unit transmits.

They also have a voter system with their UHF radio system. Basically many repeater systems have several input sights all over town. When a unit transmits on the input frequency (say 465.100) the signal may be received at several sights at the same time. The at the dispatch terminal there is a very sophisticated Voter that will vote or select the best signal to be repeated on the repeater (in my case it's 460.100)

As a unit transmits you can look at the voter board and see what sights he is hitting and you can also see which sight the voter has selected as the best signal. From that and from the unit ID you can get a very good Idea of who it is and where abouts they are.

It is however interesting to note that even thought a unit may be very close to a particular sight.. he'll end up getting received better on a further away sight. Also in the middle of a transmission, the voter may change it's mind and decide on a different input sight.. so you might hear a sudden change in the volume or tone of the signal similar to cellular trunking.

But even with all that.. we still get stuck mikes and they still seem clue less as to who has that stuck mike..I guess sometiems it will no ID.. Does anyone know that since most agencies tape their radio traffic ..does the Id info etc remain with the tape and can be brought up also.

Oh yes, and the police and fire units have an Emergency Id button.. and they can push that.. and it will then flash the Id and an alarm will go off in dispatch. If a radio gets wet, this will happen also. Dispatch will tell the unit that his ID is going off. and ask if he is "code 4" if he does not respond, she will put out an "officer needs assistance" the fire dept refers to this as a signal 4.. I don't know why.. they will say something like Engine 15.. we show a signal 4 on your portable.. are you ok? they will respond.

>older X-band radar units still in daily service. Most people having radar
>detectors which give separate alerts for each band know that - most of the
>K and Ka alerts are false alarms in many areas :-)

Note is said "Most Radar detector USERS ...". Anyhow havn't seen an "X" band unit in florida for 10 years - detectors see them ten miles away (well almmost!), so they are not effective for tax collection.

"K" alters are NEVER - repeat NEVER false. "Ka" is a pain in the BUTT! It falses all over the place, but usually at a level of "1". Unfortunately for me, my city is quite well off and has purchase some new Ka band units for the Motorcycle cops - they are deadley if ones not carefull.

Don't listen below 3.5Mhz or above 24Ghz. Otherwise you're
OK. Also be sure to take an attenuator and a lead suit with
you :-) RF density in Dayton is of biblical proportions.

Source record: 258922

I have about 20Amps worth of Yuasa maintenance free batteries. I also have a 12V 1A power supply. Will this work if I leave it charging for a while? Should I buy a car battery charger? Should I throw it all out a window and buy a *REAL* power supply? I am trying to get it all charged up enough to run a 2M amp and a 10M rig because my power supply is only 3.5 amps.

Thanx for whatever help you can render!

Pete W. (kaweiss@silver.ucs.indiana.edu) wrote:
: Uh, that's assuming, or course, that radar and radar detectors are
: intended to be used for emergencies. Radar detectors have only one purpose - to
: thwart enforcement of speed limits. More than half of the people I've seen with
: radar detectors drive above the safe speed for given road and traffic
: conditions, and often drive recklessly. They do not use them for safety or
: emergency reasons. Kerchunking in the microwave band *is* **not**, by any
: stretch of the imagination, the same as sending out a bogus SOS.
: Pete.

And just who are you to define a "safe" speed???
The speed limit here is ridiculous. I'm from Germany and some of the
roads (that are well maintained) provide the same conditions as the
German Autobahn. As you might know there is no speed limit on the
Autobahn (except around exits and curves, etc.)... AND... The accident
rate in Germany is LOWER than the U.S....
That tells me one thing... The problem isn't driving too fast, the
problem is people who don't know how to drive driving too fast...
Maybe the U.S. should change their licensing requirements and raise the
speed limit to at least 80Mph... (I'd say that's about the lowest speed to
go in the right hand lane in Germany if you don't want to get run over...)
The truck speed limit in Germany is 55Mph BTW, because a fully loaded
truck is a danger, even with an experienced driver if it goes too fast...

Project Falcon (jtamdor@iastate.edu) wrote:
: I disagree. The radar detector is a device people use not to save their
: lives in an emergency, but instead to endanger their own and others' lives
: for entertainment. Excessive speeding is not only inefficient, it is also
: dangerous - many fatal crashes occur due to reckless, speeding drivers.

Incorrect. See my previous reply talking about the German Autobahn w/a
higher or no speed limit. Germany's accident rate is lower than ours on
these roads. I repeat myself again... The problem isn't people going too
fast, the problem is people who don't know how to drive going too fast.

: The fact is that speeders who do not want tickets learn to rely on
: their radar detectors. Light is green, go as fast as you want. Light turns
: red, slow down. These speeders are Pavlovian subjects, trained to vary
: their speed out of fear of punishment rather than fear of accident or death.

The people are people who are not retired and don't have all day to go
1000 miles at 55Mph...

: For those of us who believe that some laws are valid tools in protecting
: life and property, we can use this dependency to create safer highways.
: Using a x band transmitter specifically for the purpose of setting off radar
: detectors encourages veteran speeders to slow down and drive carefully. Or
: do you want people to get killed in car accidents?

I agree... Some laws are valid tools... The speed limit law as it is isn't...
I repeat again... Higher speeds to NOT NOT NOT result in a higher
accident rate... A higher fatality rate yes I believe, but not a higher
accident rate... Even the NTHSA states that in some of their reports
about states that changed the speed limit to 65 from 55...

: The only caveat is that these transmitters are dangerous if they interfere
: with law enforcement's use of radar speed determination. Then, speeders who
: do not care about getting tickets may be protected from legal punishment.

Why should anyone be punished for something that 80 percent of the people
do anyway? A higher speed limit (although not officially posted) is
common law... Just because some stuck up legislators haven't changed the
law yet doesn't mean the law is good... Because I can assure you that
these legislators don't give a fuck how many accidents occur... They care
about being able to get some $$ out of speeders for their unbalanced
budgets...

213. ABOUT BUYING A POLICE SCANNER

Newsgroup: rec.radio.scanner
Date: 1995-04-04 00:00:00 UTC
From: "..RT ka pyara Boy.." <kali1@gl.umbc.edu>
Message-ID: <Pine.SGI.3.90.950404113816.1216C-100000@rpa01.gl.umbc.edu>
Source record: 258926
Cross-posted to: rec.radio.scanner,rec.auto.driving

I have been driving for over six years now. No cop has yet had the priveledge of pulling me over, even though i do have a somewhat flashy car. I tend to drive relatively fast. Avging 80-85 mph on maryland interstates (where the speed limit is still 55). Untill now i have just been spotting speed traps by using my brain. SOme of these cops just make it so damn obvious where they are. However, i know that if i get caught at the speed i drive at, the fines will be high. Therefore, to be on the safe side i have decided to buy a police scanner or radar detector.

I am considering the following:

Radar detector: Passport (the new one with the big screen), a Bel 645sti, or the new BEL 745sti

police scanner: Uniden Bearcat "BEARTRACKER"
Police scanner

Would someone please give me advice on these,

Thank you!

Ali

By state law you are not allowed to have a scanner in your car unless you're a licensed Ham operator. If you are a firefigher, EMT or whatever, you have to go to your local authority and get an exempt permit (where I live, the Sheriff issues them). Without a such permit or Ham license, you are subject to prosecution and I believe the penalty is up to $1000 fine and/or up to 6 months in jail.

216. Mod for Bearcat 220XLT wanted!

Newsgroup: rec.radio.scanner
Date: 1995-04-04 00:00:00 UTC
From: caroth@news.epix.net
Message-ID: <3lrtkd$7m8@grape.epix.net>
Source record: 258929

I need a mod for a Bearcat 220XLT to get as much frequency coverage out of it that I can. I definitely want cellular, but it would also be nice to get more frequencies in general, like 55-108, 175-405 and 513-805...

Any info that someone might have is appreciated.

Please let me know if you know of e.g. an FTP site that has mods. I'm currently aware of one (QRZ.COM).

Thanx in advance,
Christian

Try 856.800, 857.800, 858.800, 859.800. Since you know one of the freqs, try finding out who is licensed for 860.800. When you find that out, look up all the freqs under that name. This requires someone with access to something like Percon or a dial-up freq search service.

It would also help if you listed what area of the country you're located.

Also, what's the business name? Someone else may already have all the freqs in the system.

>I am going to be traveling to Maryland and want to listen while I am
>there. Does anyone know the frequencies for Howard County Maryland
>Police and Fire? How about any other frequencies that may be
>interesting in the Baltimore/HOCO Area? Thanks in advance.

Police 1 - 159.09
Police 2 - 155.595
Police 3 - 155.37 (low power)
Police 5 - 155.115

Fire 154.22 & 154.25 both active

The police sometimes use Gov't 3, which I don't have with me but maybe
someone else has it. During the day, it is used by the county. At
night, it's back to the cops.

Police 1 is Adam and Baker sectors/units 1-5. The day shift is 1,
eve is 2. So Adam unit daytime in sector 3 would be
Adam 31. Charlie, David and Edward units use Police 5.
They are east and south parts of county, including Columbia.
Police 2 is chit chat between units. SOmetimes used for
27, 28 and 29 calls. Adam units are western county.
Nighttime calls go to Victor, William, and Xray units.
The county splits into only 3 sectors. Send me details
if you get more than I have.

That's a good point; I'd have to look more carefully to see if that's a reliable indicator.

In any case, the person didn't complain about the accuracy of the advice in my "form letter", he complained about the attitude he imagined to be behind it. Then he proceded to email me and display his =own= attitude. Those on this newsgroup who know me, I'm sure, would not consider me to be a "prima donna" in the least.

He also denied that he had emailed in response to MY post ... since it was obviously threaded from my response and not the original query, I decided it wasn't worth pursuing. Some people won't take friendly advice, and I only try once.

>and it seems to be working pretty good...

I think you need to go back and read the manual. Wideband antennas are the worst type for the Scout, because they will significantly increase the number of false readings. They bombard the unit with so many strong signals that the "randomness" estimator has a tough time figuring out what's real and what's noise.

I'm pretty sure the PRO-39 duckie is the same as the PRO-43. This redesigned GRE antenna SUCKS on VHF-lo and 800. You can do better.

To answer your question about a good all-band duckie: the GRE all-band, which was originally shipped with the PRO-34 (and is still available from RS parts) is also sold directly by GRE and by others like CRB Research. This is my standard all-band duckie - not a superstar on any particular band, but not a dog anywhere either.

Someone mentioned the Austin Condor. Superb too ... even on VHF lo where it doesn't even have a tuned element. But it's h-u-g-e ... imagine attaching that to the diminutive Scout and then trying to put it in your pocket. Ouch!

>>I am thiking of buying a Uniden 855XLT scanner modified for cellular.
>>Is this a good scanner? Am I making the right choice?

Sure, it is a desktop version of the BC-200 XLT hand-held,
Cellular mod takes about 4 min. to do.
Great scanner in a small package. I leave mine on all day.

Refurbs are $120, new ones are around $150.

Find a local "ham" operator and ask when the nearest hamfest fleamarket is
in your area. Many dealers carry these.

I had a real nifty frequency allocation chart some time ago that I found on the net that I managed to lose. It had a listing of all the frequencies from about 100khz to several Ghz as I recall. At the end of the list was a chart of all the cordless phone freq's and Cellular ranges. I think it also had a listing of the TV channels sound and video carrier (although they may have been in the main body of the list). If some one has it, I'd appreciate it if someone would either Email to me or post it.

>the scanner chances are they wont bother you. It reall depends on the cop.
>If you have more question E-mail me.

As I said before, I've been stopped twice in NYS, once by a trooper
the other time by a Livingston County Sheriff-Both times I was clearly
speeding and probably deserved a ticket. IN both cases I didn't get
a ticket-and I wasn't even asked about the 3 BC760's and Vertex
two way in my car. I am an EMT,(and a college student) but I didn't
ID myself in either case. I have Mass Plates on my car, which may have
saved me in terms of the scanners, but still-It does depend on the cop
and probably the fact that all the scanners went off as soon as the
red lights came on. The only thing I ever got asked was, "You must
be from Boston."

JM> possible to get the number that is being dialed FROM the cell
JM> phone?

Ignoring the ECPA, your best bet for such hardware is to simply get a cellphone hacked to the same number as the one you want to monitor, then follow that phone around. Even this will not get the number dialed, unless you can decode the tones.
From a practical point, any scanner that has a tape-out jack can allow you to record the calls. Most of these are base units, but most of these have the ability to operate fron 12VDC. The scanner must be able to tune to the cell frequencies, of course, which means an older unit, as newer ones are cell-blocked, and not easy to modify to unblock.
Following the cell call from cell to cell will be the problem. There is no way to do this without some sort of computer system that can interpret the commands to the cell phone telling it which frequency to switch to. While some people claim to have software to do this, I have yet to see any actual reports of this working. In all cases, also, the hardware requirements to do this would be rather high. The proprietary software to do this doesn't seem to be available to any but the most devoted (read: able to pay) hackers.
ECPA aside, the civil consequences of what you want to do might be very high. Unless, of course, you have the permission of the target phone user, or are studying this as an educational pursuit.

JC> PRO-46's we have seen recently begin with Cxxxxxx indicating they are
JC> sourced from a Chinese manufacturing plant, wonder if they are the same
JC> in the US ?

If they don't have an "A" prefix, then it would seem that they are capable
of being modified to receive cellular (if they don't already).

JC> You could perhaps go by the RS catalogue number though. I beleive the US
JC> models are 20-xxx on most scanners. Most of European versions
JC> are 20-9xxx. The PRO-43 is 20-300 with you, over here 20-9300. Likewise
JC> the PRO-2006 was 20-145 - with us 20-9145.

The different model numbers are because the scanners are different; namely,
in the diode matrix to determine what frequency bands are enabled.
The service manual even says: "Catalog number: 20-300/9300". The PRO-43 with
Cat. # 20-300 uses an "A" prefix to denote an inability to be modified to
receive cell freqs. On CAT #'s 20-9300, there may not be a need for the "A",
as they may be modifiable. Can you tell?

Well let me tell you how it works around here. The Herkimer County sheriffs office has told us long long ago that they will not issue scanner permits to anyone. The only way I got to have one legally is by holding a valid Ham license. At least in New York you have a chance to at least apply for one. On the other hand all of the people that I know of and have scanners in their cars never applied for a license. I suppose your allways taking a chance though. Also I dont think most cops bother you about your scanner unless your a big jerk and give them a reason to give you a ticket. I do know of an old CB friend of mine who got pulled over for speeding and the cops confiscated his scanner. As I found out later the only reason they did is because he told them they couldn't.

252. AOR8000 or Yupi MVT7100?

I have decided to look into the ultimate handheld scanner for myself, and these two models look the best. The question is, which one (let's assume price is not an issue, I'll be as cheap as I can get away with!)?

Has anyone had experience with both, and a preference for one or the other, who could lend me an opinion? I'm looking for reasons, large or small, that are significant enough to sway your decision to one or the other.

On the whole, the feature set of the AOR appeals to me more (particularly the computer interface), but it appears the Yupiteru has generally been considered a better built, slightly better quality unit (this is my assessment from all of the mail I have read on either unit). I see a lot of mail complaining about minor AOR problems, nothing major, but enough things overall that I wonder about it.

Can anyone help me out on this one? Thanks in advance for your frankness.

In article <3lrscf$r3@newsbf02.news.aol.com>,
Jmmorrison <jmmorrison@aol.com> wrote about finding the trunked
frequencies used by a particular business:

>.... Since you know one of the freqs,
>try finding out who is licensed for 860.800. When you find that out, look
>up all the freqs under that name. This requires someone with access to
>something like Percon or a dial-up freq search service.
>
>It would also help if you listed what area of the country you're located.
>
>Also, what's the business name? Someone else may already have all the
>freqs in the system.

There's another way to find this information -- examine transmitter
site information as used by RadioMap(TM) transmitter
location reports. Aside from identifying towers
and sources of interference, identifying trunked freqs
is one of the reasons I developed RadioMap(TM).

Here's the scoop: Since SMR trunked systems have several frequencies,
and each user is licensed to transmit on each frequency, the FCC
license database was growing at a phenomenal rate. For a 20
channel trunked SMR system with 30 users, the old way of recording
licensed frequencies required at least 600 records (20 * 30)
for the input freqs plus 600 records for the output freqs!

Now, the FCC is using a new scheme which reduces the number of records
they have to keep in their database by listing each business user only
once -- on 806.000 MHz.

That's bad news for scanner folks, who are interested in the repeater
output frequencies. In newer systems, output frequencies
appear *only* under the name of the repeater (trunked system) owner.

So how can you determine what frequencies Framus Auto Parts uses
when a search of FCC records shows only a single entry of 806.000 MHz
for Framus? Answer: find all the license records for all
the trunked transmitter frequencies at the same transmitter site.

The color RadioMap(TM) plot uncovers the trunked output frequencies
and associate business users with output frequencies because
RadioMap shows the transmitter site location, and lists all the
licenses located at the site.

From the rec.radio.scanner FAQ article:

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" scaled color map marked with transmitter sites and cities (no streets). I call this innovation RadioMap(TM) service.

It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Industry uses RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites.

This is completely different from, and independent of the Grove Enterprises CDROM.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states. Send $25.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Note: I cannot respond to electronic mail inquiries about RadioMap. Please call the telephone number above if you have questions.

Of course, if you don't have access to the vehicle that the cell phone is mounted in, you could not use some device like the Interceptor, which is not from Starcom (I think that isn't the name of it), not hooked up to a voice activated tape recorder, to not track the cell phone over cells, and not record every part of any conversations that don't go over that cell phone. Quality would not be very good, and you would have to know the frequency ahead of time.....

264. PRO 2032, discone, RG-58 question

Newsgroup: rec.radio.scanner
Date: 1995-04-05 00:00:00 UTC
From: donahued@wc5.wl.aecl.ca
Message-ID: <5APR95.14370748@wc5.wl.aecl.ca>
Source record: 258778

Hello,

I have a PRO 2032 with the standard telescoping antenna. Reception was not too bad, but to make it better I put a RS discone in the attic and fed it to the 2032 with 50 feet of RG-58 coax. I don't think the reception is much better than with the stock telescoping antenna. I plan to put the discone outside on a 20 foot tower, but wonder if it is worth the effort.

Question: Could the lack of improvement with the discone be due to excessive signal loss in the 50 feet of RG-58. Would RG-6 or mini RG-8 improve the situation?

Thanks in advance for your help.

Dave

265. EEB Update

Newsgroup: rec.radio.scanner
Date: 1995-04-05 00:00:00 UTC
From: clark.neider@iotp.com
Message-ID: <8A6D495.059E000798.uuout@iotp.com>
Source record: 258779

Last week, I posted my story aboutsending an AOR AR1000XLT into EEB for warranty service. I also sent the accessories and an itemized inventory of same. I was chagrinned to find my scanner returned without the accessories. EEB claimed that they never received them, even though the missing items were listed on their own packing list as well.

UPDATE: Ms. Kimberly Stoner of EEB was kind enough to put together a package of the missing items out of the EEB inventory. It was shipped UPS Blue Label last Friday and arrived yesterday. No one admitted culpability, so everyone saved face and I'm contented to have my scanner fully operational again. Happy Ending.

From: KARL.ADCOCK@f17.n275.z1.fidonet.org
Message-ID: <541_9504062248@woodybbs.com>
Source record: 258780

GC> It's true, deep discharges will shorten a battery's life. Special
GC> deep cycle marine batteries are very heavily over-built to tolerate
GC> this abuse, but it is still abuse. You'll get longer service life
GC> from a battery if you limit discharges to the point where the battery
GC> is reduced to 80% capacity, IE only 20% of the battery's nameplate
GC> capacity is really usable if you want maximum service life. A battery
GC> is not like a muscle, exercise isn't good for it, and resting it won't
GC> make it stronger.

GC> The purpose of using two batteries alternately is so that you won't
GC> find yourself in a situation where *both* batteries are dead. This
GC> is a commonsense way to operate a vehicle battery system. Using
GC> both batteries together would require you to watch discharges very
GC> carefully to avoid getting caught in this situation.

GC> Lead acid batteries can tolerate an occasional deep discharge to
GC> nearly zero terminal voltage. It's not good for them, but they'll
GC> usually survive.

GC> >The question that comes up is, "Does this apply to Ni-Cad batteries as
GC> >well?". I have been told to discharge my Ni-Cads almost completely
GC> >before recharging to avoid the dreaded "memory effect". However, I
GC> >don't want to shorten the battery life unnecessarily. Any advice on how
GC> >best to manage Ni-Cads?

GC> NiCad chemistry is different, but some of the same ideas still apply.
GC> The manufacturers typically rate their batteries for 500 full charge/
GC> discharge cycles, or several thousand partial charge/discharge cycles.
GC> The dreaded memory effect is mostly hokum, though you can get a voltage
GC> depression effect with repeated partial discharges to exactly the same
GC> terminal voltage followed by *overcharging* the pack. This is usually
GC> caused by equipment with automatic voltage cutoff circuits that are set
GC> too high for the battery being used.

GC> While individual NiCad *cells* can tolerate discharge to zero volts,
GC> NiCad battery *packs* cannot. You should never discharge a *pack*
GC> to less than one volt per cell, or you run the risk of *reversing*
GC> the polarity of the weakest cell in the pack. This is always damaging.
GC> So for example, a 10 cell 12 volt pack should never be discharged to
GC> less than 10 volts.

GC> Gary

Gary,
I realize this a bit off topic as far as scanners go but I was wondering
if this also true for a battery pack in a laptop computer. I don't think

that the batteries are Ni-Cads but they are rechargable. any thoughts on
this?
Thanks,
Karl

267. ABOUT BUYING A POLICE SCA

Newsgroup: rec.radio.scanner
Date: 1995-04-05 00:00:00 UTC
From: Vaughan.Huska@odxabbs.tor250.org
Message-ID: <cc8_9504062203@tor250.org>
Source record: 258825

Hi.

I can't give you stats or technical specs of the radar detector
you are wanting to buy as they are illegal here in the province of
Ontario. Nothing wrong with having one, if they're legal. But what I
do have a problem with, is your intention of using a scanner to break
the law. In your case, speeding and the wanting to know of radar
locations. I don't need to tell you that as you openly admitted in
doing so. Now you expect those many of us who love our hobby to advise
you on what make/model scanner to buy in order to help you in
continuing to break your state's speeding laws? I think not.

It's inane thinking and asinine requests such as yours that
endanger our hobby of scanning anywhere in North America.

It pisses off the police when they find out what is going on
(that is why some of your country's states ban the use of scanners in
vehicles unless you are a licenced HAM operator) and then, eventually,
the politicians pass the laws as stated in the above brackets.

Buy your radar detector, but I'll be damned to help you destroy
mine and others' scanning hobby by offering you advice on what to
purchase where a scanner is concerned only so you can use it for the
sole purpose of hurling down the highway (as you stated doing 80 - 85
in a 55 MPH zone) and avoiding a tax contribution.

Freakin' newbie!

Good day....

The software, or interface some people use, does not add the Re: to the topic.
Jeff Smith's (?) posts come to mind. None of them have "Re:" in front of
them when he replies. So this is not a reliable indicator. Most software
allows you to look at the header information that has a "from:" line in it.

> 29Mhz up to 990Mhz)

If you are not trying to pull in weak signals, a discone is probably your best bet - very wide band, but no gain. Diamond sells a very good one (DJ130 or something like that). If you want wide band AND gain, than you have to go to a log periodic, which is a directional antenna, and would require a rotor. If you mostly listen to the public sevice bands, there is a $29 Radio Shack antenna that will do better than the discone since it is tuned to the 3 major public service ranges so you get some gain on these bands.

It is possible that they are going to one of the new digital systems.
These digitize all audio and send it over the air as digital data. If done
right, this just about doubles the system capacity. Also just about the
same thing as digital encryption.

Sometimes Uniden will act like they have no idea what you are talking about when you call them. Sometimes it takes some pushing before the customer service reps will "remember" the problem with the early BC2500xlt.

>a 2M amp and a 10M rig because my power supply is only 3.5 amps.

Sealed Lead Acid batteries are great for supplying that extra current needed
for transmitters. You can leave the battery on a "float" charge as long as
you want, and just draw power when needed.

Here is a fact sheet I put together for Lead Acid batteries that should answer
most of your questions.

SEALED LEAD ACID BATTERIES FACT SHEET

CHARGING
========================
Quick Reference: Float: 13.65v
Cycle: 14.70v

Float Charge: 2.25v to 2.28v per cell (Power Sonic) 12v = 13.50 to 13.68
2.25v to 2.30v per cell (Yuasa) 2.275v/cell reccomended
Current: No limit (battery will only draw what it needs)

Cycle Charge: 2.40v to 2.45v per cell (Power Sonic) 12v = 14.40 to 14.70
2.40v to 2.50v per cell (Yuasa) 12v = 14.4 to 15.00
Current: Normal is 20% of capacity. Max is 25% capacity
Charge to 2.45v/cell (12v = 14.70v) until current drops to 0.01C
then switch to float setting.

A fully charged battery will rest at 13.5v to 13.8v

Equalizing Gell-cells is not reccomended

Sealed batteries do not vent. Venting implies damage to battery.

DISCHARGING
========================
Depth of discharge depends upon the load. If the load is small the voltage
should not drop as low. If the load is large the voltage can drop lower.

Discharge limits: at 0.1C - 10.7v
0.2C - 10.5v
0.6C - 9.7v
1C - 9.1v

Cycle service will provide about 1200 cycles at 30% depth of discharge(DOD)
Float Service will cause capacity to drop to 80% after 3.5 years, and 40%
after 4.5 years.
Battery will self discharge at about 3% a month. An idle battery should be
boosted every 9 months.

For current calculations based on capacity, keep in mind that older
batteries will not have the same capacity as the battery is labeled. This
is particularly important in calculating DOD.

TESTING
==========
BATTERY SHOULD BE AT REST FOR AT LEAST ONE HOUR.

CONSTRUCION
==========
GELL-CELL: Lead Calcium (Power Sonic) or Lead Antimony

CHARGED:ANODE:LEAD DIOXIDE, CATHODE:LEAD ELECTROLYTE:25% SULPHURIC ACID 75%
WATER.
DISCHARGED:ANODE:LEAD SULPHATE, CATHODE:LEAD SULPHATE ELECTROLYTE: 5%
SULPHURIC ACID, 95% WATER
TEMPERATURE: LOSES 20% CAPACITY AT 40F

: Seems that lately Grove Enterprises will sell you one of the Standard US Cell
: Blocked models for around $600.
:
: If you want one of the unblocked models, I wound up paying about $850 including
: shipping from Atlantic HAM radio in Canada.....
: Javiation in the UK is a little cheaper but I am not sure of the price.
:
: If ya wanna play ya gotta pay.............But the song remains the same.
:
:

Point of clarification here - I also got the unblocked AR8000 from
Canada (Lorenz Radio) and also paid the $850. But remember, that's
$850 Canadian $, not US. The conversion of dollars netted it out
to about US$605, plus about 37 bucks I paid to the UPS guy here
for customs excise. I believe the price just jumped recently to about
$900 Canadian due to the fluctuation in the Yen.

At the time, I think US versions were about $640-650, so I was only
a little ahead of the game.

Mike

So why do my discharged motherboards grow "fuzz" on the nicads
if the nicads are allowed to go discharged for a while?
They must then be replaced. I have the same problem with single
cells out of circuit.

You're correct Andy, but typically fusing a dedrite that has grow from
plate to plate does not work very well due to contamination caused.
Effectively, the short will typically return.

The dendrite growth is caused, primarily by reverse current. That is,
current forced to flow through the cell from neg to pos when the cell is
discharged. This current is sourced by other cells in a battery that
are not yet discharged. This is overcome by matching cells in a battery
(in terms of capacity) which results in all cells in a battery becoming
discharged at the same time. This also the reason for discontinuing use
at 1 volt per cell because in a pack up to say 6-7 cells, the loss of
volt contributed by one cell can be distingished from all cells at the
end of capacity voltage (approx 0.9 volts). Also at 0.9-1.0 volts, less
than 10 percent of capacity remains anyway.

Thanks for the opportunity,

Dave KB7ZEK

284. Re: How to best manage Ni-Cad batteries?

>Gary Coffman KE4ZV

Gary,

High quality modern NiCad batteries do not exhibit memory effect. Memory effect occurred as you described by long term cyclical use of some portion of a cell's capacity.

What is still a battery management issue is "voltage depression" which is caused predominately by over charging. Over charging is defined as continuing to charge a cell after it has reached full capacity. This causes cell heating (and in extreme cases out gasing and loss of electrolyte) which in turn creates the "voltage depression" effect. Typically, the actual capacity still exists, however, it is provided at a lower cell voltage which fools low battery detection circuits that have fixed voltage threshold.

Thanks for the opportunity to comment,

Dave KB7ZEK

285. Handheld Frequencies?

Newsgroup: rec.radio.scanner
Date: 1995-04-05 00:00:00 UTC

Hello,
I am trying to find likely frequencies for a handheld tranciever
that will work in a automobile. From the description I got "it looked
like a walkie talkie with a white ceramic short fat antenna ".
Any clues might help. I suspect GMRS as CB will get lots of
static in a running car. Could it be a Ham tranciever in simplex ?

Thanks,
BREATHE!

Grundig YB-500 - 1

I was looking at the Grundig Yacht Boy 500 recently because of its having RDS - I suspect that the RDS on the Satellit 700 is similar / identical. It has a diagnostic feature where you key something like 1-2-3-4-5 before switch on. It then will read various details of the RDS - like PI, TA, TP and also the RDS "quality".

But it does not use any of these features. It displays the PS - station name - but I am not sure if it uses the AF automatic retuning of RDS. It display the Travel News flags TA & TP in diagnostic but does not use it at all.

There is a clock on the radio but it is not updated from the RDS CT clock. Its a great pity that a bit more thought had not been put into the design. Incidentally this diagnostic function is present on some car radios, usually needs a series of key presses to get into the mode.

I ended up getting the new Sony RDS radio - its not a SW radio just VHF/MW/LW I was quite disappointed with the design of that also and wrote to Sony in Japan - they confirmed my suspicion that it was designed in Japan where they have no RDS !

It does update its clock from CT though. Also uses the TA/TP flags to allow you to get Travel News from another channel.

They do not have fully automatic returning using AF but you push a button to step through the various Alternative Frequencies.

I was most disappointed by its not fully using EON (Enhanced Other Networks), it has it so that it can retune to another station for Travel News. But I was hoping that I would be able to tune one memory to BBC Radio 2 in a new town and the other 4 memories would be loaded with the local frequencies for Radio 1, 3, 4 etc using EON. But it doesn't.

****

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but
are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home

(no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year
now and am really pretty happy with it.

Advantages: Size - Measuring approximately
4 3/4 x 2 5/8 x 1, you can take this little
mini anywhere! Even slip it into your shirt
pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m,
25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals,
no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The
SW sensitivity is quite good for my area of the
country, Cleveland, Ohio. The speaker has a nice sound
and improves thru the earphones. FM stereo thru
headphones is great! MW DXing is surprisingly
good! I can grab signals from Boston, Chicago,
New York and Cincinnati much better than on my
Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun
to fiddle with or take for travel when you're in
a pinch. Radio Shack has discontinued this model
so you might be able to find it on sale for around
$50.00. I love the size! Ideal for travel! I'm
beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-350 - 1

I bought this radio when I first started out in shortwave listening because it was the cheapest thing at Radio Shack. I think I paid $60 for, but I'm pretty sure the price has gone down since then.

Nowadays I mostly use it as my travel radio. Sesnitivity is okay for the price, but not too great. When I'm at home (western US) I can pick up the major international broadcasters, but no too much else. On my trips back East, I've found sensitivity picks up some, but it's still only fair.

Performance on the AM and FM bands is average, but longwave seems to be nearly useless. I've never heard any nav beacons on this one, even though there are several near my house.

Radio Shack sells a reel antenna for about $8, and I picked one of these up when I bought my radio. It helps reception a little, but not very much. A much better solution is to wrap a stripped end of a wire around the the whip antenna, and attach the other end to a metal windowframe. I've tried connecting my longwire to it, but that just overloads the receiver (not surprising).

One major problem that I've noted is that the dial markings on some shortwave bands seem to be off by up to 10 kHz. If you know about it, it's not much of a problem to work around, but initially it could be quite confusing.

Overall, this receiver is average for its price. There's no real surprises, either good or bad. If you really want an inexpensive radio, go for this one. Otherwise, I would advise saving your money and going for an inexpensive digital radio.

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a rebate. For the price I think I got a good deal. It has digital tuning and direct input of frequencies which allows tuning to be a pretty simple job and not a time consuming act of patience. It uses two C type batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in the front or side pocket of an average sized backpack. It is just great when you are walking back home from school/work ... it can be easily carried in one hand as you catch up on the news from BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep with music... the FM sound is pretty good in stereo (headphones)... The AM reception is also fairly good but it has a very high tendency to catch those Bible bashing stations...probably a reflection of the region where I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify
this. I bought it on sale from Radio Shack for the
bargain price of $129.95! It regularly retails for
$179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380
is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even
better! I read another review that said reception was lousy....I think
that individual should check his particular receiver as he might have
the rare defective unit. MW reception is also outstanding and with a
Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up
Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the
select-a-tenna! With the S-A-T reception gets an added boost!
(these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like
something smaller, like the 606. This size, however is fine. I've
carried hardbound books on jets that are larger. The many features
makes up for it's slightly larger size over a mini. It does not have
SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought
it for the price of $179.95. There are other radios in that price
range that ive ya more bang for the buck. At $130.00, it's a great
deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some
of my experiences. First of all, I would pay the extra to get the

390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells) They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making

this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it.
I miss the 512 memories of 700 and 'SSB clarify' control
sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However,
it is rather simple to make it work similarly to '700 and '2010,
because the detector chip is the same in all three. Only a switch
with two pairs of contacts is needed. Another design fault, the
excessive distortion in SSB mode, can be partly cured by adding
two resistors. For serious DX-ers it may be important that the
internal ferrite rod cannot be disabled on MW and LW in both 500
and 700, so the in-house noise may become a problem on these
bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise.
Similar number of cubic inches as the Sony (different shape), but
offering some features of the R8. Also the Lowe is made with a
mostly solid alumnum case, which is better than the Sony or the
Drake. The Lowe has dual antenna inputs (wire or SO-239), record
out, audio out, 12vDC in. It can run off any 12V DC battery.
I use 7 aH gelcells which I recharge. The Lowe also takes
8 internal AA nicads *OR* disposable batteries. It will recharge
the nicads with a builtin recharger if you plug it into
an external power supply. It's a nice semi-portable radio. It
has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with
it. I use it mainly for broadcast listening. It's connected to
25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial
and the coax, and on some frequencies it gave a (small)
improvement in signal strength, but it was such a pain to keep
retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to
offer the best of both worlds - improved matching between the
wire and the coax, but no retuning necessary. It's rather
expensive, though, and it may be that I'd have been just as well
off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong
signals well away from where you're listening, seems to be

completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is

activated at the touch of a button radio and shows in the display
as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline.
It disappears after about 5 seconds. As soon as the number of
dots reaches 0, the radio shuts off immediately. I ran a a series of
tests with Radio Shacks Super Alkaline batteries and got the
following results: 3 dots showed for 37 hours, then 2 dots showed
for an additional 11 hours, and finally 1 dot showed for 3.0 hours
for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the
volume control set at 1/2 volume most of the time). At $2.89 (plus
5% for tax) for a package of four AA batteries (the radio takes 3),
that figures out to 4.5 cents/hour which is excellent. This figure differs
greatly from that given in the 1994 Passport (25-30 cents/hour). I have
no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-
scanning, forget it; it will drive you crazy. But at about $140.00 plus
shipping (NYC mail-order) it's an excellent "second" radio to carry
around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I
ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it
exclusively at home, moving it from room to room. It really is
too large for travel

I've found the sensitivity to be tremendous on SW, MW
and FM! Very rarely do I need to attach a clothsline
antenna! It has continuous SW coverage, a great sounding
speaker, BASS and Treble controls, two bandwidths, great
sensitivity, good spurious signal rejection...It has
all the features I wanted in a starter radio! I bought
it about three years ago on sale for $150.00! I still
don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB

or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable
for under $200. However, I accidentally crossed paths with a
Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a
local store and had to check it out. It is an analogue set, but
since I got a 30-day return policy on it, what the heck? Good
points: analogue tuning so no problem with confining 5kHz
tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK
and Sangean away with the number of stations I picked up, good
selectivity (no fine tuning knob - all you need to do is turn
the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small
whip antenna (only 18"), addition of Radio Shack rollup
longwire increased sensitivity even more, great low price (if I
lose it or its gets destroyed, no problem replacing it), tuning
bands are wider than the major broadcast bands, so you do get
some utilitiy reception as well as WWV, AM and FM are really
sensitive while FM goes from 76mHz to 108mHz so I can pick up
some TV as well. Bad points: frequencies cover only seven
broadcast bands (I can live with that, though), only monaural
earphone included (however, you can get a $1.39 mono to stereo
headphone plug), no BFO for SSB or CW, no station memories. All
in all, this radio gave me the best price/features/size ratio
of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I
purchased this little radio. Sure, it's not top shelf, but it's
suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour
clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is

covered from 7100 to 7300. So if you want to listen to the BBC on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European signals during the day that I cangrab when I attach a long wire. The 3625 can't tune these freqs. but it can grab 15400 (from africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average selectivity. Covers MW (in 10 kHz steps only), FM (no stereo), and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-in timer/clock (12 hour format only), 5 programmable memory locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers MW, FM (stereo through headphones), and SW in 8 bands (roughly split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and 60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic window for the digital display, which the factory replaced. It is an extremely sensitive receiver. I installed the FM detector board option, which is highly useful for Sub-Carrier detection from FM broadcast receivers in conjuction with the R70's ability to tune below 100khz without a frequency convertor. The so-called PassBand Tuning (PBT), in actuality an asymmetrical bandwidth narrowing control, is very mediocre with the factory 455khz filters. Replacing the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole crystal filter (equivolent to the ICOM FL-44) makes the passband

filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than
the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product
detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's
low-pass audio filter, giving better bass response than normal SSB mode on
the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option
board; both can coexist. Installation is somewhat difficult, as it involves
connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This
installs fairly easily in place of the narrow CW filter. It is very much
better than the stock ICOM 6 kHz bandwidth, which is wide-open until it
hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter.
They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard
synchronous detector for the R71 as well as other receivers. The Kiwa MAP
unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual,
which details mods like enabling the preamp on MW, true pass-band tuning,
sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to
put it in here.The TS-450S is an amateur transciever that costs little more than
a R-5000,and if you have your ham ticket or are thinking about getting it,may
be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is produce when a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can

swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive you bonkers if you have good hearing and a speaker that can put out the highs. I have had two of these,the first I traded for a sateite setup,and the one I have now.The newer reciever has mucbetter audio then the first one and lesess hiss too.Ergonomics are very good MUCH,MUCH better than the Drake R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh well,back to the 525,if you are into AM,it's probably not the reciever for you, but in allthe other modes,it is one of the best consumer grade recievers ever made.Performance in all modes is basically excellent except fothe audio pr problem,and stability is rock solid.JRC has only cut a few corners compared to the 515,probably the ultimate in construction for consumer recievers. The case is made of very thin sheet metal and the front panel is plastic.The keys fit loose in the keypad but work ok.The display has four brightness levels and is very easily read from across the room.The S-Meter is "digital" and is a floating vertical bar segment that seems to be yellow on some samples,

and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

****
Japan Radio Company NRD-535D - 2

I have been using a NRD-535 for two years and i am very pleased
with it. Although the relative high price makes this a radio
for the serious DXer and maybe not the average Shortwave listener.

The NRD-535 has very good ergonomics. It is very easy to operate
during long listening passes. It has 200 memory channels which comes
in handy for storing interesting frequencies that you want to
check later, or stations that you want to check regulary.

+ side:
On the plus side there is the BWC and the very good sensitivity.
The BWC combined with the PBT makes it possible to make
a station readable that is very close to another station, or
a interfering RTTY transmitter. I find that i mostly uses
the SSB mode and zero tunes the station, and then uses the
BWC and PBT to get the most readable signal. The BWC and
PBT has saved a lot of reports for me. The sensitivity
is excelent. It is among the best in this price class.

- side:
The audio in the built in speaker is mediocre to put it mildly.
A station that you read loud and clear in the earphones can be
inaudible in the built in speaker. The selectivity is not as
good as it could be. The NRD is very sensitive for splatter from
nearby stations, and this can totally drown the station that you
want to listen to. The ECSS option that you can equip your NRD with
is a joke. I have it installed but i NEVER uses it. The only time
you can use the ECSS with any improvement of the signal, is if the
received signal is strong to begin with. Don't waste your money on
the ECSS.

The conclusion is that the NRD-535 is a very good receiver for the
serious DXer but it has some shortcomings. The 535 is much better
than the Icom R-70 that i had before, and i would recommend it to
anyone that asked me. What you might want to do is change the filters
to somewhat sharper filters. That goes for both the 9 MHz and the
455 kHz filters.

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent
portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the
Sony ICF-SW33 and the Sony 7601). This rig is an extremely
sophisticated piece of equipment. I especially like the fact
that you can store up to 125 frequencies on 25 electronic pages
that can be named as you wish (by country). Once programed this
is very convenient. The two filter selections are well chosen
(much better than the stock Sony 2010 filters). My use the radio
to copy WEFAX with excellent results attests to its stability
(and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow
automatic recording with certain tape recorders (Sony and others)
of up to five times and frequencies in a 24 hour period. I use
this feature all of the time. Audio (stereo on FM) qualitity for
a portable is very good; better I believe than the stock 2010
although as with the 2010, it is improved with a set of external
speakers.

Unlike the 2010, the SW55 does not have synchronous detection.
That's too bad because I believe that if it had this feature it
would blow away
tition. As it stands it is an excellent radio. Most
interference can be eliminated with the narrow filter or moving
away from the interference a bit (the radio is tunable in steps
of 0.1 kHz) so the lack of sd is not critical. I really
believe that Sony did not include it because it would have then
had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had
in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE
keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now
that I've said that, you should know that I am new to all of this "DX-ing" (is
that how you say it?). However, I can tell you that it's reception with the
built-in antenna and with the included auxiliary antenna is very good. I found
that the radio comes pre-programmed with a number of stations (BBC, Radio
Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high
quality, delivering plenty of volume and good sound. There are several "tone"
switches (news vs. music setting, etc.) that enhance the reception and its
sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to
other radios since I didn't comparison shop). There are several output jacks
that make it easy to connect to external speakers, tape recorders, headphones,

etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position

Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient frequencies, like the propagation beacons on 14100 KHz. There are a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous detection (this is supposed to be sent out as an upgrade chip later), and IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think it will be the last one I will have to buy for quite a while.

Watkins-Johnson HF-1000 Review Part 2

Watkins-Johnson SAM option for HF-1000

Recently I received the firmware for installing Synchronous AM (SAM) detection in my HF-1000 receiver. I was able to install it in about 1/2 hour and it worked great. In testing it I compared it to the

ESKA phase lock AM board installed in my NRD-525. Here are the results
for strong and weak signals:

Parameter ESKA+NRD HF-1000+SAM
--------- -------- -----------
Weak signal lock range +- 20 Hz +-250 Hz
Strong sig lock range +- 40 Hz +-900 Hz

As an on-the-air test I tried to lock onto Radio Pyongyang, 13760 KHz at
1300 UTC. The signal was weak and fading rapidly at 1300 UTC and was being
broadcast on 13760.1 KHz. The HF-1000 was able to lock it immediately even
when set to 13760.000. NRD was not able to lock it at all, even when set to
13760.1. Impressive!

Another modification in the new firmware is a change in the AGC function.
It is now possible to set three decay rates from the front panel for each
AGC setting, Fast, Medium and Slow. In addition it is possible to allow
the manual gain setting to control the AGC threshold while in AGC mode.
This is a great help for the AGC control. I spent many hours trying to
get the AGC decay rates correct on my NRD receiver, and was never happy
with that AGC. This required pulling out the IF board, replacing some of
the SMDs, putting it all back together, and then trying it. Digital AGC
processing on the HF-1000 makes this a snap, taking only a few seconds.

After several months of using this new mode of reception, it is the one
I nearly always use for SWLing and DXing. For weak AM signals it is hard
to beat. If the signal is readable at all, it will be able to lock on it.
By using both sidebands, you end up with a better signal to noise ratio
than with only one sideband. The HF-1000 is even more impressive now
with this addition. The only times that I have had to resort to ECSS on
AM signals is when there is interference on one sideband. Watkins-Johnson
reports that they will have single sideband SAM in the future which will
get around this. There are several other options that they are working on,
one of which is a plug in board for PC processing. I assume this will have
real time spectrum analysis and memory functions built in.

****
AR3000 - 1

My general impression, is that this is anyhow a very good apparate. It
offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing,
quite good operating commands, triple conversion, 400 memories; it is
very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected
front-end band filters reduce to some extent unavoidable intermodulation. In
general, this set offers a self contained and very well balanced compromise
of a lot of different demanding features, but will show its best when fully
interfaced.

Its price, here in Italy, has been varying greatly during the years.
Therefore I cannot say how it really competes with the choice of HF
receiver + scanner setup. It is still unclear to me how far is the AR3000
from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going
to list (I would like to hear comments about), but perhaps I'm
just pretending too much from a receiver in which something had
to be traded off between versatility and performance. Please note
that I have a 4 years old AR3000; some defects could have been amelio-
rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack
of a variable Am bandwidth. SWL in crowded bands is too often spoiled by
the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once
sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent
signal lying some -+30 khz apart. I suspect this may be rather a problem
of AGC voltage (see below on squelch), because the feedback signal is
obtained from the previous to the last i.f. stage, which may have a larger
than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional.
On my set almost everything passes for knob positions below .3 and
only >S6 passes when I increase to .5. It may be a problem of adjustment,
but also reflect the inaccurate behaviour of the S-meter, which (I have
no measurements to support) seems not properly logarithmic. I have
the impression that weak signals give a high S readout when close to
stronger ones, because the S-meter averages on a larger bandwidth than
the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity
improves a lot when connected to an external speaker or lineout. No
noise reduction circuitry is present. External audio equalization does
a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different
demodulator (say wide band AM for satellite or TV, stereo FM decoder,
sinchro SB AM decoder). A modify could be to buffer it to a backpanel
jack.

-Intermodulation IS present. I live very close to power MW transmitter,
and in the times they're on the whole band .5 : 2.5 Mhz is unusable,
with crosstalk on every possible combination of transmitter frequencies.
At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even
with a short random wire antenna. However, I don't hear crosstalk due
to FM transmitters, which are also close to my place. The 13 front
end filters seem to do their job, since strong signals don't cause
crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In
the AR3000a it has been replaced with a (I guess optically encoded) smooth
one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod
itself seems quite easy too.

The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories
.
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

288. Re: Primadonnas on Internet

Newsgroup: rec.radio.scanner
Date: 1995-04-05 00:00:00 UTC
From: kjn@netcom.com
Message-ID: <kjnD6K48o.2zH@netcom.com>
Source record: 258846

As a bystander to this I'd like to make an observation.

Jeffrey492 says
:
" You know Mike I am not perfect. I am new to the internet, I do not know
" all the ins and outs.

We've all been there before and others will follow behind us. This is a
very good example that points out, what one person perceives may *not* be
the reality of the situation. (Yes, sometimes it is tho...)

" But Mike I do know I have spent a lot of time in
" life avoiding dealing with up tight perfect folks like you.

Seems as if you're still not willing to accept *your* part of what has
happened here.

" Yes, your response to me pissed me off so bad it demanded expletives.
" But now I just feel sorry for you, because I my know alot about some
" subject you may need to know, and Mike you are the last person I wouls
" want to help.

Not a very mature attitude to display publicly in a venue available to
millions! These strong emotional responses over a trivial misunderstanding
accomplish little except to show that *you* need more experience in areas
other than "netiquette". While Mike may have contributed to it by name
calling after the fact, the initial misunderstanding occurred on *your*
part. Why not just move on from it???

All of us have been "new to the net" at some point or other. Most of us
have managed to shove our foot in our typing mouths once or twice. Some
of us learn from the experience. Others continue show that they are overly
sensitive and unwilling to admit that they may have misjudged a situation.

Sorry that you're `introduction' to the net has been traumatic.
But, Hey. Get over it...

Regards;
Ken Navarre

PS: another suggestion...
When posting a tirade, it helps to use spell check or proof read your
responses before sending them. At least then you appear to be _literate_
as well as "pissed off".

:) sorry, couldn't resist...

: systems being sold on the false pretense that scanner listeners cannot
: monitor trunked systems. I visit Kansas City frequently and I usually bring
: my scanner. Can anyone shed more light on the situation?

Yes - partially. Two possibilities:

[1] They plan to pay for and use DVP encrpytion on all frequencies all of the time.

[2] The motorola rep did a good job of indicating that the common folks can't listen to them on the new system. I have seen this FALSE REPRESENTATION several times in Orlando, FL. The most recent was when the Orange County Sheriff moved to 800 mhz. They were told they could no longer be listened to by scanners. FALSE! I listen to them all the time. They were shocked to learn they had been told wrong! Same story with Seminole County Sheriff a number of years ago - FALSE newspaper account.

I'd suspect option 2 of the two is what you will discover. It's not exactly easy - but it's possible. Turn OFF DELAY on ALL TRUNKED FREQUENCIES. Lock out the control frequency, but keep it in the scanner as it rotates (normally). From time to time, you will need to unlock old control frequency and lock out the new one. Believe me, you will know when it changes, digital buzzing sound. It's not easy, but it can be done.

How many others have seen this.....

Kentucky Department of Transportation several years back installed small silver boxes with small windows on them that transmit a carrier signal on radar solely for the purpose to prevent the use of radar detectors on Interstate 75 coming into Cincinnati.
They were installed on overpasses and telephone/utilitty poles about every half mile or so.
This situation was made public a few years back and KDOT specifically stated the purpose and advised that in doing so was not in violation of any Federal Law. Of course this provoked a very heated debate with the public.
Threats of vandalism were made and the last that was heard was any one caught damaging such devices will be prosecuted for willfullly damage or destruction of public property.

After many years the motoring public finally accepted that the use of radar detectors in this 5 mile stretch of highway was limited to the "off position" until motorist cross the bridge into Cincinnati.

I have an early model BC2500XLT and had always experienced an unusually high level of battery consumption. I recently found out that there was a design flaw in some of the early BC2500XLT units (does not apply to recent units).

I returned the unit to Uniden and they performed free of charge:

a) a battery enhancement modification
b) an alignment, and
c) provided a complimentary extra battery.

If you suspect that you have a problem similar to mine, look up the date of manufacture on the back of the unit and then call 800-297-1023 (Uniden service number). They can advise you. The repair was handled very quickly.

I feel good about Uniden Customer Service. A few years ago they repaired my DX-1000 shortwave radio very efficiently at a nominal charge.

By the way, I am not affiliated with Uniden, just a happy customer.

Koert Koelman

Yupiteru MVT-7100

SPECIFICATIONS

Frequency Coverage: 530KHz-1650MHz
Modes: AM, NFM, WFM, LSB & USB
Increment Steps: 50, 100Hz (LSB/USB only), 1, 5, 6.25, 9, 12.5, 20, 25, 50 & 100KH (50 & 100KHZ only on WFM)

Sensitivity:
0.53 - 2MHz:
AM: Less than 10uV(S/N 10db)
2 - 30MHz
AM : Less than 1.5uV (S/N 10db)
LSB/USB: Less than 1.0uV(S/N 10dB)
NFM : Less than 1.5uV (SINAD 12dB

30 - 100MHz
AM : Less than 0.5uV (S/N 10db)
LSB/USB : Less than 0.5uV (S/N 10dB)
NFM : Less than 0.75uV (SINAD

1000 - 1650MHz
NFM : Less than 1.0uV (SINAD 12dB

Memory Channels: 1000 (10 banks of 100)
Search Banks:10
Search Pass Channels: 500
Scan Speed: Approx 30 channels per secon|
Search Speed: Approx 30 steps per second
Delay: Approx 2 seconds (standard)or 5 second

Dimensions:644(w)x155(h)x38(d)mm
Weigh: 320grammes
Antenna Connection: BNC Fitting

Supplied Accessories

4 x AA Nicad batteries, AC charger (12v DC, 200mA output), BNC telescopic antenna, Belt clip, wrist strap

Optional Accesseries

Yupiteru soft vinyl pouch with clear plastic windows over screen and keypad.

Radio has NEVER been used outside of the vinyl case.

Radio is in EXCELLENT condition..

$550.00 by US Postal Money Order

Please email response.

Matt,

I didn't look in a Grove catalog to review Ant-8 caracteristics, but from memory it is an adjustable whip? It is likely to improve low frequency reception (ie; low VHF) as it can probably be adjusted to a half wavelength at those frequencies while a "rubber ducky" is probably effectively a quarter wave at UHF Public Service band (460-465MHz neiborhood).

I suggest continuing to use the "duck" on 460MHz or a collapsed telescoping antenna and use a telescoping antenna at low freq's. Adjust you antenna length per 460/F(in MHz)=feet, thus for monitoring Ham 2 Meter band: 460/146=3.15 feet (approx. 1/2 wave fudge factored for antenna materials, 1/2 wavelength in air is different).

Hope this helps, sorry if it doesn't,

Dave

RA> have been told that this does not pick-up the 800Mhz frequencies. One
RA> of the Channel Master antennas was also mentioned, but a salesman who
RA> is *really* into scanning told me that they are rather cheaply made.
RA> He recommended one by a company called Diamond...
RA> Is what he says true?

The Diamond D-130J is indeed a good antenna. It's a discone, with specs that
say it receives from 25 to 1300 MHz. In the real world, it actually performs
well from 50-900 MHz. From 25-50 MHz, performance is down, but still decent.
Cost will be around $90US (plus shipping).
If what you want is a single antenna, this may be your best bet.
If you can handle more than one antenna (and an antenna switch), there are a
LOT of better antennas that cover smaller bandwidths, and have some gain
(discones have no gain to speak of, despite what Monitoring Times says).
Another solution could be to go to Radio Shack and get a TV antenna, turn it
on it's side, mount it on a rotator, and have a really good, directional
antenna, with decent gain.
Hope this helps.

309. Radio Shack vs. Realistic

Newsgroup: rec.radio.scanner
Date: 1995-04-05 00:00:00 UTC
From: christan@uhunix4.uhcc.Hawaii.Edu
Message-ID: <D6Ko9x.8n3@news.hawaii.edu>
Source record: 258867

I am interested in purchasing a scanner, so I went down to my local Radio Shack for a catalog. First of all, I found out the scanner that I wanted, the PRO-43 has been discontinued since November 1994. Bummer! Anyway, I am looking at some of the other handhelds (like the PRO-51 and the PRO-62). However, I noticed that all of the scanners in the catalog (with the exception of the discontinued PRO-43) go under the Radio Shack brand. Was the PRO-43 the last of the scanners under the Realistic brand? Are these "Radio Shack" scanners still be made by GRE and Uniden? Is there a DIFFERENCE in quality, etc. between "Radio Shack" and "Realistic"? Is there any Radio Shack in the nation with a PRO-43 lying around in the backstock or able to find one? Any help would be greatly appreciated.

Thank You,
christan@uhunix.uhcc.Hawaii.Edu

310. Pro 51 or Pro 62?

I'm a big fan of the BC 760 with PL board...I use three of them in my car (when I'm not causing controversy by asking how to set off radar detectors...)

HOWEVER..The lamp bulbs in two of them have burned out. This happened to me when I had a BC580 (same case as 760 without PL or 800) and I sent it to the lovely people at Uniden who took quite a while to replace the bulb. Anyone else have any ideas on bulb replacement? Anyone have this problem? Ideas? Comments? Suggestions?

Let me know...Post or Email at fsw9724@ritvax.isc.rit.edu.

Thanks...Scott

: interstates (where the speed limit is still 55). Untill now i have just
: been spotting speed traps by using my brain. SOme of these cops just
: make it so damn obvious where they are. However, i know that if i get
: caught at the speed i drive at, the fines will be high. Therefore, to be
: on the safe side i have decided to buy a police scanner or radar detector.

: I am considering the following:

: Radar detector: Passport (the new one with the big screen), a Bel
: 645sti, or the new BEL 745sti

The Passport is great (that's what I have)... I think it's model number
is 5000...

: police scanner: Uniden Bearcat "BEARTRACKER"
: Police scanner

I'd just get a normal scanner. I had a Beartracker before, and besides
being too slow and not having all frequencies for the police around me,
this alarm thing didn't work, because most of the police cars still don't
have that transmitter it requires to be able to sound that alarm. Also,
the cop has to be transmitting to set that alarm off... In other words...
It'd worthless... Plus you can't put any frequencies that are not
included into it, either... My suggestions... Buy a normal scanner and
program it with the frequencies you need...

Same holds true for CA. Most med helos have thier own dispact
frequency, such as American Ambulance's helicopter here in Fresno.
Joe's right about just listening in on fire and amb freqs, but also
look for ambulance to hospital freqs, such as Med 10 and the such.
Some places like back where I used to live in Ventura County have a
county-wide ems frequency that is both dispacth and ambulance to
hospital. I've found a lot of ems companies on 155.205 in CA so you
might want to start there.

IF>I'm about a mile from the transmitter for a local radio station.
IF>I've been getting a lot of interference on my scanner. If I turn
IF>up the squelch it's not so bad, but I'm probably missing a lot too.
IF>Are there any filters I can get for this? I also hear the radio
IF>station on my phones and a handheld CB. Should I complain to the FCC?

Try contacting the Radio Stations Engineer. If he refuses to help, then
contact the FCC if that's what you wish. The Radio Station may have a
problem they aren't aware of. There are probably a few different methods
that you could employ regarding the various forms of the interference,
but contact the station first.

Good Luck and if I can be of any further help, just yell.

Hi Guys and Gals,

I'm listing this for a friend, so please, if interested, contact him.

He has a Rad Shack Pro 2006 Scanner just 6 months old. It has besides
the antenna that it comes equipped with, a Magnetic Mobile Mount
Antenna, and a Cigarette Lighter Power Adapter for it.

It hasn't been dismantled for any reason, to modify or repair.

He is looking for $325.00 or trade for a 2 Meter Amateur Radio in good
Condition of equal value.

You may contact him (Ron) at 412-785-6999.

In case you aren't familiar with this unit, it has 400 channels and
covers 25 MHz to 1.3 GHz.

Thanks

Could be a commercial band radio UHF band with a phone-patch... These allow the operator make phone calls with their radio equipment. Less expensive than a cell service, often used by service people, on service calls. Monitor a few calls and see what the content is.

You'll have to be a bit more specific as to the frequency and what
scanner you were using. It could have been conventional mobile telephone,
aero radio-phone, phone patch on a mobile repeater, or images of cellular
generated internally by the scanner. For reference:

They wouldn't have turn off their detector if they had a Valentine
One. With its multiple threat counter you could still detect other
radar in the area. It might be a bit irritating with all the beeping
going on, but you would still be protected. Ah ... technology.

: >Dan

Many Balloon crews use the VHF-HI and UHF "itinerant" frequencies for
coordination. Typically 464.5, 464.55 in UHF and there are several
"color dot" frequencies in VHF-HI like 151.625. See the back of
"Police Call" for itinerant freq listings, or one of the latest
Monitoring Times also had an article on these "color dot" freqs.
The color refers to a colored sticker on the radio or the box so that
Joe construction company buyer can buy two or more on the same channel,
without remembering the frequency by number.
So there is a red dot freq, a yellow dot freq, etc.

Chris, WD5IBS

It puts out 10mw @ 10.25 GHz. It falls through the FCC cracks as a
"test/communication" device, and be warned, be prepared to show an ham radio
liscense to the officer who has pulled you over to inquire about the radar
noise coming from your car.

How is a cop going to know what the heck is going on? It's not uncommon
to get a blank display. He may give you a funny look, assuming it even
interferes somehow. I've used signal generators a few time to zap cops,
most of the time they just give you a funny look.

I live in Bergen County, NJ. This is an area just pratically saturated
with paging services and such. I bought my AR8000 from a local dealer.
Before I bought it when we were chatting he said he had just recently just
sold a MVT7100 to someone in the area who was very dissatisifed with it.
He said it tends to pick up a lot of intermod which the AR8000 won't. I
would take this with a grain of salt coming from a salesman but I'm very
happy with my AR8000.

Source record: 258744

If I'm remembering the news story from a couple of days ago correctly, the City of Menlo Park, CA, adjacent to where I live, has acquired a bunch of handheld police radar units which it will loan out for a week at a time to private citizens living on streets with speeding problems. The individuals using the radars can write down the license numbers of particularly egregious speeders and the police will send out letters notifying them they've been observed speeding in a residential district and asking them to slow down in the future.

I hadn't made the connection until I started reading this thread, but I guess there's nothing better to set off a radar detector than a real radar transmitter. For someone who lives on a winding two-lane road having numerous residences, lots of children in them, 17,000 cars/day going past, a 35 mph posted speed limit, an 85th percentile around 48 mph, and absolutely no enforcement, this thread has generated lots of useful ideas.

338. Modification to NEW PRO-46!@!@

Newsgroup: rec.radio.scanner
Date: 1995-04-06 00:00:00 UTC
From: gdruebsamen@vms4.sci.csupomona.edu

Source record: 258745

I have been looking, for several months, for a mod that allows the newer pro-46 scanners (ones with date code 5A4 and later) to recieve full 800mhz coverage...

I know such a mod exists, because people have told me they know others who have succesfully gotten 800mhz with the newer Pro-46's....
The question is, does ANYONE know anything about this, or what the mod is, or who might have it????? The oakland site only has the mod for the older Pro-46 scanners.

ANY HELP or Info would be greatly appreciated!

Thanks in Advance

p.s. Please e-mail all responses...

I bought one too.
Actually the Tropez which is manuf for ATT phone (so the Tropez girl sez).
My friend has one out in the burbs and gets almost half a mile.
I'm two miles line of site from a 25watt (true, not erp) 900MHz
transmitter.
I get about 50 feet on a good day.
On a bad day it's unusable.

346. Which scanner to buy?

Newsgroup: rec.radio.scanner
Date: 1995-04-06 00:00:00 UTC
From: drwho00009@aol.com
Message-ID: <3m0s48$lft@newsbf02.news.aol.com>
Source record: 258788

Hello. My name is Shawn Jipp. I live in Modesto, CA.
I need some advice and help.

I am in the market to buy a good hanheld scanner, preferably new.

It must have aircraft, at least 100 channels of memory, and the capability
of receiving cellular calls.

I would like to pay less that $300.

I am considering buying the Radio Shack Pro-51 for the sale price of
$219.00 till end of April.

QUESTIONS

1) Is this a good radio?
2) Can it be modified easily to receive cellular?
3) Which scanner do you people recommend?

Thanks for advice and info!!

In considering the idea of buying a scanner one of the questions that we would all like an answer to is "Which scanner is the best?" Well thats sort of like asking what car is the best. Its difficult to answer these questions however because everyone has different prefrences. Its difficult for me to reccomend the best scanner for you but let me just share some reasoning with you. Seeing that your considering a top of the line scanner seeing that you want 100 channels and cellular band coverage I can only recommend one thing. Increase your spending budget to $400.00 and purchase the PRO-2006 from Groove. Ill give the info if you want it. I have the PRO-2006 and it will do all that and more.

I haven't had to replace the bulbs in my BC760XLT yet but I've
replaced bulbs in dozens of other scanners, monitor receivers,
and HF receivers.

If the bulbs are the 12V type with wire leads, I replace them
with either:

Radio Shack #272-1141 or
Radio Shack #272-1092

Most times, I add a resistor in series. It dims the bulb but prolongs
its life.

From: PROFESSOR
Message-ID: <3lvoaq$53h@one.mind.net>
Source record: 258798

Okay read this.

To restore cellular freqs. in realistic scanners do the following:

model procedure

2005, 2006 remove diode d502 (board behind control panel)

2002 remove diode d44 (main circuit board)

2026 clip loop L201 (sm. board behind front display btw. main and on/off swtich boards)

pro34 remove diode d11 (board behind second shield starting from cover-this one's tricky)

pro37 remove diode d13 (same location as pro34-diff. diode#)

pro 37 remove diode d6 (big board behind fromt of scanner)

pro 43 remove diode d4 (big board behind front of scanner)

Other mods are also avail: scan/speed increase, extend bat. time, add more channels, remote control etc. OR COURSE THESE MODS
ARE PROVIDED FOR INFORMATIONAL PURPOSES ONLY. PERFORM THESE MODS ONLY IF QUALIFIED OR BRAVE! AND AFTERWARDS FOR GODS SAKE DONT LISTEN.
Have fun, you just saved 20-30 bucks.

Does anyone know where I can get one of those devices to remove those
trunk tones from the 800 MHz police bands. I can't listen to anything.
I know they exist but haven't heard much on it lately. I have a Pro-39.

361. UL Listings on RS scanners?

Newsgroup: rec.radio.scanner
Date: 1995-04-06 00:00:00 UTC
From: m_c_0007@frank.mtsu.edu
Message-ID: <3lvu0l$pe9@isdnlin.mtsu.edu>
Source record: 258803

Are any radio shack scanners ul listed? I have both the pro-34 and pro-62 and can't find that seal anywhere in the manual OR ON THE UNIT. A simple thing
like a weatheradio is a UL listed radio receiver. Why not a scanner?

I had terrible problems with my pro-34 in the beginning. It seemed like it
was only made for someone to take it out of the box, put the rubber duck
on it, and plug it in. I had terrible problems with the BNC jack coming loose. I was told that the factory didn't solder the nut onto the connector, so it would rattle loose. Of course, if I never changed antennae, I might not have had that problem ;).

I just purchaesd the pro-62 two weeks ago and I think that I may be having charging problems with brand new batteries that worked fine with the pro-34. I am going to try a few things to determine if it is the batteries or the unit. If it is the unit, that baby is going back to the store (within 30 day satisfaction guarantee period) and I will never have another RS scanner again.

I will let you know what happens.

I would encourage anyone reading this to first learn how to drive, and then to construct a X-band (10.525gz) transmitter, of the 2 watt variety as I have then watch the a-hole pigs try to ticket you then. It helps to have a fast car as well, as I do not reccommend stopping for these fascist revenue agents. I live in Edmonton Canada, where the most tickets per capita are given out. we have laser, radar, and photo radar, all this to keep us safe. This year so far we have had 9 fatalitys, as opposed to 2 last year at this time. The safety problem is not speed, but lack of judgement, and common sense and skill. I routinely travell at 200 mph as I am a pilot. I don't drive any faster in my car than is safe, or fly faster than is safe. Beside the odd maniacs, the worst drivers are those pablum-puking bell curve -middle ground anti achievement civil serpant ass likers who have to check their owners manual to determine which way to turn the wheel in a skid. If you cannot adequatly explain understeer and oversteer, you just don't belong behind the wheel of a car.

Triple conversion does not reduce images, it just means they will likely be found further from the original frequency. In the case of the new triple conversion Uniden BC3000XLT, images can be picked up about 140 Mhz above the original frequency, which means that first IF is about 70 Mhz. The first IF on older double conversion Uniden scanners is about 10 Mhz, which means images are found about 20 Mhz above the actual frequency.

In the case of the PRO43, the gaps in the coverage are likely used as 'landing zones' for images of busy ranges. Cellular images likely fall above the upper range of the PRO43...

369. DJ-580T already picks up CELLULAR

Newsgroup: rec.radio.scanner
Date: 1995-04-06 00:00:00 UTC
From: skowit1@umbc.edu
Message-ID: <3m0o7d$dck@rpa01.gl.umbc.edu>
Source record: 258811

If you are looking to receive cellular, I just found out that the DJ-580T duel-bander HT (transmits on 2m and 70cm if you have a tech license) has an unmentioned capability to pick up the entire 800 MHz band (well, I think its 810-905) and is unblocked for cellular reception already. It costs in the range of $389 (I think it has a $25 rebate) which is a great price for a hand-held duel-band tranceiver anyway. I think the manufacture stopped making this model, but if you check out almost any ham radio store or catalog, you will see that they are still being sold, and they still have many in stock. I was lucky enough to find a salesman how knew to tell me about this. This capability is not mentioned in the present users guide (I think they replaced the guides after the band on cell reception) but the capability is really built in already. Hope this was a help to any of you who are looking for a small HT or just for easy and excellent reception of cellular phones.

>justifies the $10 price at Walmart.

I've tried a few of the other alkaline rechargers (wanna buy one cheap to play with? hint, hint) and found they all work differently but none is as aggressive at recharging as the Renewal charger. No coincidence, I guess - the Renewal batteries are made to take higher pressure inside, so their charger is probably calibrated to deliver higher current at a higher voltage cutoff.

Occasionally I've tried recharging standard alkalines in the Renewal charger by fooling the electrode interlock (covering the anode end of the battery with a little piece of foil is a good way). The cells get warm during charging (something that NEVER happens with the other brands) but they come out with very high terminal voltage. But on occasion I've ruined a cell entirely by using the Renewal charger; it dies within minutes of use afterwards.

This is the second time I've seen positive remarks about the Remington charger (perhaps they were both yours, I forgot!). So yesterday I passed the Remington store in the mall and noticed they were having a 1/3 off clearance on several items; the Nu Power charger was $9.99 ... I couldn't resist :-)

My standard test is to take some partially spent Renewal cells, and charge them in the third-party charger. Then when they're "done" (or charged overnight) put them in the Rayovac charger and see how much more it charges them. The Remington fared VERY well ... the Renewal charger only added a few minutes more charge time. Also the cells get warm - a sure sign the Remington is delivering more charge current.

Then I tried some regular alkalines, and found them to have much higher terminal voltage under load (I use a little tester with a #112 lamp) than any of the other chargers. Let's see if it holds up, but this does look like the best of the lot. Maybe I should buy another and put it in the closet, before these things disappear entirely.

Complaints about the Remington charger - no end-of-charge shutoff or indicator. They just say "overnight" - but the LED's seem to represent the duty cycle. Once they start to flicker, the % duty cycle is dropping because the battery voltage is rising.

I wonder how it tells the difference between alkaline and nicads ... most chargers make you manually switch to choose one or the other.

Other weirdie: every few minutes all the LED's go out for a second simultaneously, then come back on and continue as before. Perhaps that's the "pause" during which the charge circuit is looking at the terminal voltage. Anyway, enough rambling...

In the "Denver and Colorado Area" Air Life has the capability with their wolfsberg (Spelling?) radios to transmit and recieve on some 22 thousand different frequencies. Communication frequency is directed by the agency on the ground controlling the landing zone. So if you have the frequency of the FD or Amb service who initially responded to the call, you should have the frequency the helo's will use.

I wonder when this was? I was on a United flight listening to my
scanner about 2 weeks ago. The flight attendants talk was
confusing about the issue so they referred passengers to a rules
segment in the inflight magazine, where buried in the fine print
it said VHF receivers were permissible, except during take off
and landing.

381. List of 25 Cordless Channels

Newsgroup: rec.radio.scanner
Date: 1995-04-06 00:00:00 UTC
From: casato_jc@atc.alcoa.com
Message-ID: <casato_jc-060495055847@132.226.103.40>
Source record: 258823

Here's a list of the 25 cordless phone channels listed in "Police Call":
(All are in MHz and are the Base frequencies)

43.72 44.12 46.61
43.74 44.16 46.63
43.82 44.18 46.67
43.84 44.20 46.71
43.92 44.32 46.73
43.96 44.36 46.77
44.40 46.83
44.46 46.87
44.48 46.93
46.97

I had an e-mail request for these due to the recent news stories about the availability of newer cordless phones on the market using 25 channels, instead of just the 10 listed above in the 46 MHz range. Thought I'd post it here for general use.

(REPOSTING)

Uniden BC3000XLT Hand-Held Scanner, new condition, 2 months old,
complete with AC charger/adapter, user manual, in original carton.

Features:

- 400 channels/20 banks
- Twin Turbo Scan & Search (100/300 ch/sec)
- 10 programmable priority channels
- Auto Store, Auto Sorting
- Freq. Transfer
- Weather Search
- Data Skip
- Selectable Mode (AM, WFM, NFM)
- Per channel Delay
- Selectable Attenuator
- Battery saver circuitry

- covers: 25-550 MHz continuous, 760-806 MHz,
806-100 MHz (with cellular image at 1005-1030)

Price: $350 including shipping

skywalker@dino.qci.bioch.bcm.tmc.edu writes:
>Subject: Mac/scanner

Tim:

With your current configuration, there is nothing you can do to get
the two to communicate.

There are a couple of scanners that have RS232 built in and there
are a couple which can accept a 3rd party RS232 I/F. The first one
was by Bill Cheek. the CE-232 and HB-232. This was nothing more
than a glorified button pusher. The newest and most famous is by
Opto Electronics, the OS456. This will go in a Pro-2005 or 2006.
This interface allow the computer to take over the radio. You
cannot access any channels like the CE/HB-232.

Hope this helps...

> 900+ mhz or did they narrow the spacing on the original 10 ?

Here's a list of the 25 cordless phone channels listed in "Police Call":
(All are in MHz and are the Base frequencies)

43.72 44.12 46.61
43.74 44.16 46.63
43.82 44.18 46.67
43.84 44.20 46.71
43.92 44.32 46.73
43.96 44.36 46.77
44.40 46.83
44.46 46.87
44.48 46.93
46.97

I had an e-mail request for these due to the recent news stories about the availability of newer cordless phones on the market using 25 channels, instead of just the 10 listed above in the 46 MHz range. Thought I'd post it here for general use.

>station on my phones and a handheld CB. Should I complain to the FCC?

They may have a problem that would interest the FCC, but it's not very likely.
Commercial radio stations are pretty good about staying on top of their
transmissions and keeping them clean.

I presume it's obvious that your interference is coming from that particular
station? Most likely, your scanner is being overloaded by the strong signal. If
you hear the interference on many different frequencies, this is the case. I
have a shortwave radio that did this, and would hear a local station every few
KHz. You didn't specify whether it's an AM of FM station... you can get filters
for either one. Scanners are notorious for this kind of thing, because they are
intentionally desgined to pick up everything from DC to daylight, and sometimes
they receive it all at the same time!

CB, same thing as the scanner. Probably being overloaded. A well-designed CB
wouldn't have too much trouble with this, but most consumer electronics these
days have cut out simple filtering in order to save you the $2-3... great, huh?

Your phone is badly designed or broken if it picks up radio waves. See above.

Bob,

Just put a Ramsey Descrambler into service recently. It seems more than adequate to convert the "duck-talk", squabble and speech "inversion" into intelligible voice reception. I haven't experienced any of the issues you mention from my kit. I keep the volume control at about 1/4 or less and then adjust to suit, otherwise there is some whine or just plain unpleasant reception due to too much volume.

Recently sent to Ramsey for another ... this time "wired & tested".

One minor fault I would note is the somewhat unrobust mounting of the RCA phono recepticles on the circuit board. May be a fault of the "assembler". I'll see what the preassembled SS-70 offers. But, overall I'm completely satisfied.

I must admit I don't quite understand the issue of reception of the local cab company. Are they scrambled?? What is being "tuned in"? A frequency or a type of scramble the IC chip can't handle?

Happy Monitoring ...and Descrambling ...

394. News on new 46-49 MHz cordless freqs

Newsgroup: rec.radio.scanner
Date: 1995-04-07 00:00:00 UTC

Its been proven that if left to their own desicion on speed, that
the vast majority of motorists will procede at a speed very safe for
conditions. The speed limits imposed on our highways are set below what
they should be inorder to support police departments that have absoultly
nothng better to do. Like the Aubun University Police department, that
seems to think that no one is capable of driving over 35 mph on a 5 lane,
very recently re-paved, straight and very well lighted road.

>I have decided to look into the ultimate handheld scanner for myself, and
>these two models look the best. The question is, which one (let's assume
>price is not an issue, I'll be as cheap as I can get away with!)?

I *own* a Yupiteru MVT-7100, so let any of my remarks be colored by that fact. I've had it about a year, and bought it before the advent of the 8000, and have considered whether to try to sell it and get an AOR8000.

The Yupi is a GREAT radio. Actually, the only thing I wish it had is a computer interface, as I travel quite a bit and I'd like to be able to "dump" frequencies in it before traveling, then "dump" my home freqs in it when I return.
I probably use it more for shortwave (3-30 MHz) than do most people, and I have found it to be excellent for this purpose. It's AM filter is a bit too wide where the SW broadcast bands are crowded and I wish it had synchronous detection (like my SONY 2010), but all-in-all I makes a good little shortwave receiver.
As a scanner it's performance is excellent. Here in the Raleigh area we have services in the ranges surrounding 45 MHz, 154 MHz, 460 MHz and 800 MHz and it does a fine job on all of those diverse frequencies.

>On the whole, the feature set of the AOR appeals to me more (particularly
>the computer interface), but it appears the Yupiteru has generally been
>considered a better built, slightly better quality unit (this is my
>assessment from all of the mail I have read on either unit). I see a lot
>of mail complaining about minor AOR problems, nothing major, but enough
>things overall that I wonder about it.

Based on what I have seen also, the consensus seems to be that the AOR has more "bells and whistles" while the Yupi is slightly more sensitive and in general a *slightly* better "radio".
Therefore, so far I have decided to keep the Yupi and not switch to the AOR8000. But I REALLY wish someone would come up with a computer interface. <g>
However, I don't think you'd go far wrong with either radio. Of course, neither of them are cheap. Hoever, in fact both of them are marvels of technology if you consider what they do and it's actually amazing that they are as inexpensive as they are. (Note to manufacturers: my previous statement notwithstanding, further prices decreases are QUITE welcome.)

73,

What then is the total range of frequencies receivable by this radio?
I'm interested in compiling a list of currently available dual band
ham radios (handhelds) with substantial out-of-band receiving capability.

Now that ICOM now longer makes the IC-2SRA, I'm particularly interested in
which 2M/440 handhelds make the best "scanners".

Any info is appreciated.

I live in South Brunswick Twsp. (NJ) and would like to scan their trunked 800 mHz system with "Scan Defeat". I know a good amount about trunking and how it works (I learned the hard way!), but I haven't found an easy way to get around the scan defeat. Basically, the repeater broadcasts a buzzing noise on a voice frequency. It steps through the channels, so that 99.9% of the time there is the buzzing. It is NOT the control, I am sure of that. I know they have a GE Erickson system, but not much more than that. Any suggestions? Being a first-responder, I have a portable radio on this system, which lets me experiment a little. I am using a BC 200XLT, and do not have data skip, if that feature would help.
To answer other questions, I am very happy with my scanner. I haven't even had to deal with Uniden customer service. I am also looking for a base scanner, preferably 400 channel or more, and pretty much continuous band. Any suggestions there? I managed to delete (before getting an address) a recent posting about a used BC 3000XLT for sale in the Philly area. I am interested, so please write me if you are out there. I'm also looking for the "talk" (tactical) channel frequencies for South Brunswick's system. They aren't listed in Police Call because they're not liscensed to SB. Instead, SB worked out an agreement with another liscensed user to share some freq's for use as low-power tactical. Thanks in advance for your help/suggestions.

Hi there I was wondering if you have any mods for the pro-2025 scanner. I have already performed the restore cellular telephone band modifcation to it.
I was wondering if you had one that would speed it up or add more channels ect anything like that. Any text files about the pro-2025 that you could mail to me would really be apprecaiated.
Jamie

James,

My city also has the GE trunk system. Like every other scanner user and
also as a medic/firefighter in the city, I was very unhappy that they went
to the trunked system (but only from a scanner listener standpoint). We
really needed a new radio system.

I am a fairly good friend with the capt. that is in charge of the
fire/police communications division. While visiting the fire department
admin today, I decided to stop in a see the new communicaitons setup. At
the end of the tour, I jokingly asked the capt. to turn off the "scanner
buster." He asked me what I meant and I discribed the skipping buzzing
sound that you mentioned above. He assured me that this is not a "scan
defeat" system. He also told me that the "hang time" after each
transmission is to assure that the reply can grab the same channel and thus
gets the same priority as the first transission.

Hope this has been some help to you.

Brian

>How would it distingush when all these sigmnals are hitting you from
>the ones northbound from the ones southbound every 1/4 mile up and
>down the highway.

Well I am not sure how those boxes were setup. You have to know what
the normal (no police around) response was. Then, when an extra signal
appeared, you could be fairly sure it was from police radar (the threat
counter would increment by one).

Lets not talk about the arrows but just the threat counter on the
Valentine One for this situation. Let's say the the boxes where spaced
in a way that the V1 picked up 5 at all times. When the counter went
to 6, you'd know that was a new signal you usually don't pick up, and it
could be from police radar.

I am overly simplifying the situation for this explanation. It could be
a real mess not worth dealing with if enough boxes were set up close
enough together. The arrows could help to, but once again it depends
on the number of boxes and how close they are and transmit power and ....

I guess the only way to konw would be to drive through the area with a V1.

Hope this helps,

The lack of judgment, common sense and skill (and sometimes mechanical failures) certainly cause accidents. But it is almost entirely the speed which results in making them fatal accidents.

The proof is entirely statistical, so if you don't believe it, you're probably also a blissful 2 packs a day man!

418. Re: What about Trident or ICom IC-r1 scanners?

Newsgroup: rec.radio.scanner
Date: 1995-04-11 00:00:00 UTC
From: schuster@panix.com
Message-ID: <3mf3s3$2lm@panix3.panix.com>
Source record: 258631

Follow-up to my earlier reply in this thread: I've been asked to elaborate on the performance problems of the ICOM R1.

Depending on local RF environment, antenna, mode, and frequency range - one or more of the following may apply:

1. Poor (wide) IF filtering.
2. Noisy synthesizer clock - generates spurs that are mixed back into the IF stages. This results in regularly spaced, STRONG false images of received signals, as well as "falsing" which interferes with scanning and searching.
3. Poor sensitivity on shortwave, non-existent sensitivity on medium wave.
4. Poor dynamic range - overloads easily. Included duckie antenna deliberately designed to be deaf, in an effort to control this.
5. Poor battery life on internal, 300 mAH batteries. Once you start strapping on external packs, the miniaturization advantage is lost.

Item #2 (and, to some extent, #1) were remediable for a while using a proprietary upgrade from Raycom Communications in UK. They installed a "roofing filter" which eliminated falsing and greatly improved uptimate rejection. Don't bother looking for them - they ceased to exist a few years ago, and took the secret with them.

The North American introduction of the R1 was delayed for many months while a patent dispute was resolved with Uniden. During that time, Japanese units came into the US. On CompuServe, ICOM's online reps took a lot of flack about the performance of the R1. Their attitude was that it was designed to be tiny - almost as an engineering exercise - and they ahd no plans to change anything. They didn't.

In sum: good for "stealth" mode only (although the Alinco DJ-X1 might be better). Extremely poor choice as an "only" scanner, unless you live out in the sticks where signals are a few megahertz apart.

Nathan, I own a Pro62, and find the unit to be a very good handheld scanner. The unit has good selectivity, much better than some of the Uniden or Bearcat units I compared with. The people the seem to dislike the Pro62 in this newsgroup I beleive do not know how to properly program or operate the unit. I have owned several other handheld scanners and this one is the best. Give it a try for a couple of weeks, if you do not like the unit, as you stated you have 30 days to return it. I believe after learning the unit you will keep it. Unit is made be GRE (General Radio and Electronics) for Radio Shack. GRE makes various communication equipment for commerical and military users.

> In other words good luck trying to listen to a complete conversation as
> the computer switches frequencies sometimes after each dekey of the radio.

Yes it's a pain. I'm a news photographer, and one of our larger suburbs here recently switched to such a system. I've found a very unsatisfactory, but workable way to cope w/it when neccessary:

As soon as one part of the conversation is done, I hit the scan button on my PRO-51, and thanks to HyperScan, and the fact that there's only 8 channels on this system, it will usually jump to the reply part of the conversation.

One police dept. here uses a General Electric system which has an even more insidious feature. After each dekey of the mike, the computer emits an earsplitting tone (sounds kinda a like when you're humming: GE brings good things to life). I've heared that this is not intrinsic to the system, and is an option that was designed to irritate/foil people with scanners. Knowing this
police dept. I don't doubt it.

I am curious though if the above is true. Does anyone know if the Motorola System also emits these tones?

I've heard of guy here that knows how to modify a scanner, to sense the tone, and make it immediately return to scan upon sensing it. I'm hoping he'll be able to work this magic w/mine. When I finally get a hold of him I'll pass on his secret. Or if anyone else knows how to do this, I'd be eternally gratefull for such imfo.

Therefore, to be
> on the safe side i have decided to buy a police scanner or radar detector.

If your interested in speed scofflawing, you're better off w/a radar detector.
Most cops don't broadcast their locations until their called by their
dispatcher, or stopping someone,etc.. They don't just sit around
broadcasting their location every five minutes while their running radar.

A scanner will just not provide you w/a reliable means of knowing where
traffic enforcement is set up. You might even get yourself in more
trouble, if you do get pulled over w/a scanner, depending on where you
live, because their illegal
in some states.

More advice: Don't waste your time w/detectors that claim they detect
lasers, instead make sure your front license plate is real dull/not shiny.
This is where many police are taught to aim thier lasers, because it's usually
very reflective, and its at a flat angle. There's even a company (don't
know their name) that sells a clear cover for license plates, that
diffracts and absorbs laser energy, so it isn't reflected back to the
laser gun. Don't know if they work, but for someone like you it doesn't
sound like a bad investment.

Subject: Brunswick Siege

This is a preliminary investigative report, concerning the events of a police action that took place between the dates of March 31 to April 3, 1995, in Brunswick, Ohio. Information contained within this report, was obtained from (1) eyewitness accounts, (2) media accounts, (3) law enforcement personnel, (4) testimony of public officials at the Brunswick Safety Meeting of April 5, 1995 (5) Pictures we took of the remains of Mr. Lekan's home (6) Transmissions on police scanners.

*** Background Information ***

John M. Lekan (pronounced 'lay-ken), 54 lived at 4095 Rolling Hills Dr. with his wife Beverly, 49 and their son John Jr. aged 9. John Sr. was a disabled chemical engineer. Beverly Lekan is suffering from Multiple Sclerosis. The Lekans lived at this address for at least nine years.

All accounts indicate that John Lekan was an eccentric, a Veteran, an NRA member, a gun owner, a political activist, and a Patriotic American who had a strong dislike and fear of the government. There is also a consensus, hat while in his home, he carried a loaded firearm for personal protection.

Beverly Lekan received care by home health aides employed by the Medina County Human Services Department. John Lekan, Jr. attended Kidder Elementary School in Brunswick, Ohio. He was a quiet, well behaved student, he excelled in math, and interacted well with neighborhood friends.

*** Thursday - March 30 ***

John Lekan became angry when his wife advised him that the health care aides had filed a complaint concerning his firearms habits with a young child in the house, and told her that the police would probably be accompanying them upon their next visit. One report said that Lekan described how he could kill the health aide with just the butt of a gun, however, there are no reports that Lekan actually threatened to kill or do harm to anyone. According to Mrs. Lekan, her husband loaded all of his three firearms that night, and was prepared to fight.

*** Friday - March 31 ***

* 3:00 pm: Brunswick police officer Sam Puzella, accompanied by an unnamed Brunswick detective arrived at the Lekan home.

* Puzella knocked on the door.

* When Lekan refused them entry, Puzella kicked the door in.

* Lekan shot Puzella in the chest.

* 3:30 pm: A MetroHealth helicopter airlifted Puzella from Lekan's property.

* 8:30 pm: Police attempted to rush the home.

* Lekan shot two more police.

* The neighborhood was evacuated within a one-half mile radius.

* Gas, electric, telephone and water service was shut off to the Lekan home.

* Fiber-optic cameras were installed on light poles and the interior of the Lekan home became visible to the police.

* Street lights were knocked out by police.

* Firehoses were run into the basement, where Lekan and his son had retreated, and water was pumped in at approximately 1,000 gallons per minute.

* Later that day, four SWAT teams, 300 law enforcement personnel, 200 fire fighters, and two Armored Personnel Carriers converged at the Lekan home. (*)confirmed by Police Chief Beyer at Brunswick Safety Meeting on April 5, 1995

*** Saturday - April 1, 1995 ***

* 11:00 am: APC breached the garage door, tear gas was inserted.

* APC breached the east wall of the house, tear gas was inserted.

* APC breached the backyard patio doors, tear gas was inserted.

* Later police reports indicated that Lekan and his son died during this period.

*** Sunday - April 2, 1995 ***

* 10:15 am: Police fired tear gas through broken windows and drove an APC up to the front bedroom window, which they then entered (located at the south-east corner of the house) and emerged moments later with Mrs. Lekan.

* Mrs. Lekan's bedroom, is located at the north-east corner of the house, separated from the front of the house by two interior walls.

* Brunswick police chief Patrick Beyer later said, "SWAT team members reached in and grabbed Beverly Lekan, who was confined to a bed in the

first-floor bedroom."

* Approximately twelve SWAT team members entered the Lekan home and some four hours later emerged with the bodies of Lekan and his son.

* Police chief Beyer stated that the bodies of Mr. Lekan and his son were found in the bathroom, partially within the shower stall.

* Medina County coroner Dr. Neil Grabenstetter said both died of single gunshot wounds to the head.

* A gas mask and two acetylene tanks of oxygen were said to be found in the bathroom.

* A 10-gauge shotgun, a .27 caliber rifle and ammunition for both were also said to be found in the bathroom.

* The deaths have been ruled a murder / suicide.

Additional Information and Observations:
Reports heard over police scanners

* Between 8:30 pm Friday and 6:00 am Saturday: Water was being pumped into the basement at over 1,000 gallons per minute to force Lekan and his son back up stairs. We walked around the perimeter of the house four days later - the ground near the house was still drenched.

* Snipers were given orders to shoot Lekan on sight. One sniper was heard saying he had him in his sight and requested permission to shoot, but permission was declined, saying "no, not yet".

* "We got the flag, does that mean we won ?"

*** Wednesday - April 5, 1995: ***

* A Brunswick Safety Meeting was conducted by police chief Beyer.

* J.J. Johnson & Rick Huffman attended the meeting.

* Police chief Beyer stated that the otime-lineoe as reported by the Cleveland Plain Dealer, was an accurate representation of the facts surrounding the incident.

* Jim Polzner, of Alternative Paths (a contracted service of the Medina County Board of Health), stated that there may have been some mis-quoting by the press.

* Polzner said the police action was "awesome".

* Polzner assisted in the negotiations with Lekan and stated that Mr. Lekan was babbling, rambling, jumping from one subject to another, and sounded very confused.

* Claiming respect for the family, Polzner declined to reveal the content of their conversations.

* Our witnesses in Brunswick, who are acquainted with an officer who was at the scene of the Lekan siege, say the officer told them that Lekan's rantings included such phrases as: "you don't have a warrant" and "My Constitutional rights are being violated".

* The officer also stated that Lekan's unreported request to speak with family members was denied.

* J.J. went to the Lekan home with Rick and our Brunswick witnesses after the Safety Meeting.

* The house has been moved off of its frame.

* The front door, which we have pictures of, has 24 bullet holes in it - they are clearly all entry holes.

* The front door has also been fire damaged from the bottom edge, to about 6" or 8" up.

* There are no less than 39 bullet holes in the exterior of the house - all entry holes.

* There is no evidence of any shots being fired from the interior of the home, unless they were shot through the windows, none of which have any glass left in them.

* Mr. Lekan's "arsenal" consisted of a shotgun, a rifle with folding stock, a handgun, and a gas mask

* Mr. Lekan's flag pole stands bare on the railing of his front porch.

Additional Observations and Opinions

* The Safety Meeting of April 5th was attended by about 150 neighborhood residents and other concerned citizens.

* Comments overheard were: "Murderers" - "Another Waco" - "Lekan's only mistake was having bad aim". Some demanded the resignation of Chief Beyer and J.J. overheard two of Lekan's neighbors saying they had received threatening phone calls to keep their mouths shut about what they saw.

* After the meeting, J.J. walked up to Chief Beyer, shook his hand, introduced himself as a member of the unorganized militia, and asked him if there was a warrant to enter Lekan's home.

* Chief Beyer withdrew his hand, said "No Comment" and walked away.

* Tony Gilbert, who has previously prosecuted police for Constitutional violations, was quoted as saying: "There was no circumstance that required an immediate response. No threats were made, no hostages were taken, no injuries were received." and "You just can't bust in a door because you think somebody may be in danger. You need some probable cause."

Questions

* Why was Lekan found with a gas mask and two oxygen tanks if he intended to commit murder and suicide ?

* The Lekan home is a single-story house with a simple floor plan. Why did it take the SWAT team nearly four hours after entering the house to locate the bodies ?

* One officer stated that sometime around 11:00 am Saturday, after the multiple APC assaults upon the home, he heard "muffled gun shots" and believes that is when Lekan killed his son and himself.

* At that time, there was no glass left in any window, including the sliding patio doors. There was no garage door and the east side of the house (which is where the bodies were found) was torn completely open. If Lekan used a shotgun to kill his son and himself, the shots would have been extremely loud, not "muffled".

* Why did the SWAT team enter the front bedroom window to retrieve Mrs. Lekan, when her bedroom is located at the back of the house and separated from the front by two interior walls ?

* Why did Chief Beyer say the SWAT team members reached into the bedroom window and pulled her out , when the bedroom she was in is not inside the window that she is pictured being extracted from ?

* Why wouldn't Chief Beyer comment on the issue of a search warrant ?

Concluding Remarks:

While everyone we spoke with said Mr. Lekan was an "eccentric", an "odd-ball", and even a "flake", no one that we have spoken with is of the opinion that he was a danger to himself or others.

We will never know if Mr. Lekan made the statements to the health care aide that he was accused of. Assuming he did - while definitely inappropriate and even menacing, those statements do not construe a threat of physical harm. It has not been shown that Lekan _threatened to kill_ her nor has it been demonstrated that Lekan _intended to kill_ her, therefore there was no probable cause for the multiple violations of his civil rights.

*** April 5, 1995 ***

At Beverly Lekan's request, her husband was burried with his arms around John, Jr., who cradled a teddy bear in his arms.

One Final Observation

John Lekan, Jr. will never again play on the swing set that stands waiting for him in his backyard

Does anyone know the transmit frequencies of SJPD's vehicle repeaters to
their handpacks?

(I hate this "do you know" questions but what else is there?)

Thanks in advance.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I've recently purchased a pro-62 and so far, not so good. I'm starting to look at the AOR8000. I was wondering how complicated a scanner it is. Would I be able to just punch in a freq. and press a button and listen to it without having to program it in a channel? Would I be able to basically program the banks and be able to use the basic scanning features after 30 minutes of reading the manual?

Even if the 8000 isn't as simple as the pro-62, it's a small point since I belive the 8000 is a quality scanner.

For those of you who have had experience with the pro-51, pro-62, and or AOR8000, how do you think the sensitivity and reception compare?

Thanks in advance.

Hi,
I'm looking for info on defeating the speaker cutoff on a Pro-46. When I insert a 1/8 plug into the ear phone jack, the speaker cuts out. I want to use the "ear phone" jack as a "line out." So I need to use the built-in speaker to monitor the signal. I wonder if there's some kind of physical mod I can perform on the jack itself.

Anyone else tried to do this?

MK

430. Re: AOR8000 or Yupi MVT7100?

Every scanner has strengths and weaknesses. YOU have to decide what is most important - quality, price, features, selectivity, etc.

I had an ICOM R7000 - wonderful reception characteristics, but not enough memory, and it has some poor user features. I sold it and bought an AR8000 mainly because of the computer interface (for backup) and the alphanumeric readout. I find it easy to use and it fits my needs of small size, battery operation, and full coverage.

Good luck with your decision.

what about image rejection in a strong signal area....which have you found t be the best??? thanks.... JoeWo@aol.com

Go to your local Radio Shack and ask for the following:

Item: Nat. Part #: Express Order Number:
Front Case Z6648 1121 8781
Rear Case Z6649 1121 8799
Top Cover Z6651 1121 8815
Front Cvr Ass Z7050 1122 2023

Prices? They can find out when you get there!
And they will be shipped dirrectly to your home!

>> Since both units are made by Uniden, is it possible to get the
>> sub-audible tone board on the radio shack 2026? If so, is there tech
>> issues I should be concerned about?
>Aside from the similar looks (a BC-760 ripoff) the PRO-2026 is nothing
>like the 760 inside. It will not take the 760 CTCSS board.

Which brings up a query I have: the PRO2026 has terrible intermod rejection.
Does anyone know if the BC760 has a much better front end which rejects
intermod better (e.g. a tracking front end)? To combat intermod, I put
a 20 db attenuator on the PRO2026--which all but eliminated the intermod--and,
unfortunately, all but eliminated the signals I *do* want to hear. *sigh!*

Z[S>HELP:

Z[S>I wasn't able to purchase a PRO-43 because there weren't any available at
t
Z[S>particular location, so instead I bought a PRO-46. I played with it for a
Z[S>while then took it back to purchase the PRO-43 at a different location.
Th
Z[S>problem that I encountered with the PRO-43 is that I can't seem to pick up
Z[S>the cellular[mobile or portable] phones around the 900Mhz range. Could
thi
Z[S>be due to:

Z[S>1) the PRO-43 has this triple thing installed?

No

Z[S>2) the PRO-43 is defective?

No

Z[S>3) anything else?

Yes. The 43 needs to be modified to pick up cellular in the 868-893
range. I don't recall what diode it is, but if it was manufactured
recenly, it won't matter,as it will have been modded at the factory to
never pick up cell. Any one have the date code for pro 43 re. the cell
mod and whoch diode it is to cut?

Z[S>Any help would be greatly apreciated before I go to Radio
Shack and return Z[S>PRO-43 for a PRO-39 or PRO-51.

You'll have the same problem with the 51

While we are on the subject of MSP and Howard County, don't forget to monitor the HQ channels as well (besides 39.10 which is Ch A1), we have:

channel a2 39.26
b4 39.24
b15 39.34
b16 39.62
barracks to barracks 155.19
portables 151.475
mobile extenders 155.73

Also 39.28 might be worth programming; it is sometimes used to relay other services. 39.56 is a coordination frequency between MSP and Baltimore county during chases and escapes and the like.

(Oh yes, before I forget; I-695 in the Howard county/Anne Arundel county areas is covered by Glen Burnie barracs, ch.B10 39.04) See ya....Mike Agner KA3JJZ_

The two BC760XLTs I owned are hypersensitive and prone to overload when connected to an outdoor antenna. They also have minimal image rejection.

Due to the anemic front end, I use only an indoor 19" whip antenna on the 760s.

Having said that, tests show the later BC890XLT and its PRO-2036 clone are even worse. The inexpensive BC860XLT (base model) performs better than the BC760XLT, BC890XLT, and PRO-2036, and will be reviewed in the May 1995 issue of Monitoring Times.

442. Airplane Freq. Allocation

When airplanes take off from an airport, they use the clearance freqs. Then, that I am aware of, the plane gets instructions from the airport it just left to change to a certain air-traffic controller freq for instructions.

What channel (i.e. clearance, departure ctrl., tower) is the instructions that tell the plane to change freq. transmitted on?

Thanks...

>: by the electrons supplied by the adaptor and it might take a longer time
>: than let's say 12 V. Is there any harm doing that?

Think of it as trying to connect a pair of buckets with water
in them together.

If one of those buckets of water has 10.8 pounds of pressure where
you connect them and the other bucket has only 3 pounds of
pressure....it really doesn't matter how much water either bucket
has, or how long you leave them connected....the water will only
flow from the 10.8 pound bucket to the 3 pound one.

Voltage is the electronic analog of water pressure. Electrons
will only flow from a higher voltage to a lower one. If you
want to charge a 10.8 volt battery, you need a charger which
can put out more than 10.8 volts.

In <hellfire.29.00139A96@mcs.com> hellfire@mcs.com (Joe) states:

| Does anyone know how to hook up a radio to play over the
|Phone lines? When I do it, it is all distorted. What do I need to do to
|bring the line level down?

I think you need a device used by amateur radio operators called a
"phone patch"... ask up on rec.radio.amateur.misc about this or
go to the library and look at the American Radio Relay League (ARRL)
Radio Amateur's Handbook. It's basically an impediance matching
transformer with some ancillary components. I think the telephone
line side was something like 600 ohms impediance...

Mike, it happens to me and I've seen posts that it happens to
others. One fella thought it happens if you are listening in
manual mode to a locked out freq and then power off. I'm not
so sure about that, since I wasn't doing that when it happened
to me, but I can't figure out what causes it yet.

I used to make that trip quite often. The CHP uses 40 mhz, so you will need an
outside antenna that will work in this band. You can hear a lot with a good
antenna

You are not subject to the same laws police are. While they may not use something used in an illegal search or seizure if you obtain something illegally and pass it on to the police, they may obtain a warrant based upon a (reliable) source--you. Informants are deemed reliable all of the time regardless how they obtain there information. Essentially the fourth amendment applies to cops. Lastly, I wouldn't tell the cop how you got your info unless you were offered immunity.

Helpfully
alg7@Lehigh.EDU

P.S. This is not legal advise---just knowledgable advise.

The PRO-51 has a keyboard mod but it gets old real quick. The PRO-2006 is nice as well as the PRO-43. My advice (here we go an expert...NOT) is to go to Radio Shack, get their catalog and there is a table that tells you all the charachteristics (i.e. channels, banks, double or triple conversion, freq. coverage). This will start your quest for knowledge. Then get your hands on back issues of Popular Communications, Monitoring Times, QST, and any other publication (there are alot of good ones out there) that is related to this topic. That should get you in the arena...Welcome.

P.S. Scanners are like farts, everybody has them but unless it yours it stinks. Good Luck, this is a good newsgroup, you did well.

Unfortunately Laser is pretty damn accurate. The good news is that it is much more picky about what it will give a reading on. If you aim for the front plate (yes, they are told to aim for it) then you'll get a good return. If you aim for a bumper you may not get a good surface return. The thing about laser is, you either get a return or you don't. It doesn't do all the screwey stuff radar does. AN officer may aim at you car and squeeze trigger but he won't always get a reading. The more stable the Laser platform, the better laser works. Handheld works but not as well as a tripod. I've read Ohio is telling their officers to always use the tripod. Does any one have any info on this?

: What channel (i.e. clearance, departure ctrl., tower) is the instructions
: that tell the plane to change freq. transmitted on?

: Thanks...

The way I think it goes is: plane contacts ground control for taxiway guidance, then contacts tower for permission to take off, contacts departure for intructions right after takeoff, depature control then tells pilot "Contact <FAA Center> on <freq> G'day".

Subject: BC3000XL PROBLEMS
Date: 10 Apr 1995 22:57:44 GMT
Organization: MTSU ISDNLIN ISDN-Connected Newsserver
Lines: 44
Message-ID: <3mcd58$9o7@isdnlin.mtsu.edu>
NNTP-Posting-Host: frank.mtsu.edu
X-Newsreader: TIN [version 1.2 PL2]

I have been having some problems with image frequencies on the BC3000XL.

I talked with Uniden and was told that, because of Triple Conversion,
images should be 300 MHz away from the true frequency.

However, I believe that I have located images even closer to the real
frequency.

On 817.5125 I hear a pager that I also hear on 928.7875. (They are the same,
they cut on and off at the same time and the sound of the data
changes at the same time on both frequencies).

I believe that the 817. frequency is an image because the FCC licenses pagers
to around 930 MHz and because I don't hear pagers on 817.5125 on any other
scanners that I use.

Here are some image tests that I have done.

Actual frequency Possible Image Deviation
---------------- -------------- ---------------
928.7875 817.5125 -111.2750
857.2375 999.1750 +141.9375
929.5625 817.4375 -112.1250
155.5650 154.6550 -000.9100 *
Approx. 856. Approx 1000. Approx. +144

* Regarding the 155.5650 / 154.6550 MHz possible image
While listening to a radio station on 105.7 with priority
turned on, the unit switched to 154.6550 MHz by itself.
HOWEVER, 154.6550 was NOT set as one of the priority
frequencies (there was no P beside the channel number).

The unit was also in manual mode.
```

Nothing was heard on 154.6550 on two other scanners, but the same transmission was heard on 155.5650 on the BC3000 and the two other scanners. (155.5650 is the frequency of the police department heard on 154.6550 on the BC....)

Thanks to anyone who can give assistance to me.

: fedpress@omnifest.uwm.edu
I paid about $100 for a Uniden BC350 which works very well. The
interface is simple enough to use while driving, and it holds
memory storage for a nice long time.

The prestored channels are mostly public service, but it takes
one bank of 20 frequencies and 30 others in the predefined banks.

I had a 2026 before that, but the buttons were just too tiny and
close together to deal with in the car.

466. New GMRS 10 Channel At Radio Shack

Newsgroup: rec.radio.scanner
Date: 1995-04-12 00:00:00 UTC
From: robert@eden.com
Message-ID: <3mfcqf$e92@boris.eden.com>
Source record: 258660

I was in Radio Shack and saw that their 2 channel GMRS radio is now on clearance for around $150 which is an excellent price for such a small radio. But I was noticed a new Radio

It's a 10 channel handheld.. about the size of the pro 43.. it has a digital display (LCD). I turned it on and changed channels using the up and down arrow keys. They were numbered and labeled very unusual.. something like Emerg 1, Emerg 2, info 1, info 2..

does anyone have a complete listing of the exact freqs and what they are called. the front of the radio says 462 Mhz... and the catalog number was PRS 101 or something like that.. (personal radio service?)

I asked the Radio Shack dude for the manual and he said it was in the back. Also on the front of this radio was a big EMERGENCY button.. It looked like an emergency Id and I was afraid to press it but I did anyway and it instantly went to EMERG 1 whatever that frequency is.

: >How would it distingush when all these sigmnals are hitting you from
: >the ones northbound from the ones southbound every 1/4 mile up and
: >down the highway.

: Well I am not sure how those boxes were setup. You have to know what
: the normal (no police around) response was. Then, when an extra signal
: appeared, you could be fairly sure it was from police radar (the threat
: counter would increment by one).

: Lets not talk about the arrows but just the threat counter on the
: Valentine One for this situation. Let's say the the boxes where spaced
: in a way that the V1 picked up 5 at all times. When the counter went
: to 6, you'd know that was a new signal you usually don't pick up, and it
: could be from police radar.

: I am overly simplifying the situation for this explanation. It could be
: a real mess not worth dealing with if enough boxes were set up close
: enough together. The arrows could help to, but once again it depends
: on the number of boxes and how close they are and transmit power and ....

: I guess the only way to konw would be to drive through the area with a V1.

: Hope this helps,
: --
: Russell Keating, N9LIL -----------> Send email to: russell1@intgp1.att.com

If there is drone radar all over the place you don't have to worry about
real police radar in the first place. If they get you with radar you can
get out of the ticket by telling the court about all the possibilities of
interference and harmonics from the drone radar...

Can anyone help me identify freq 418.3 ... The one book that I have, top registry (etc.) says that it belongs to USPS ... I haven't the slightest idea. The traffic is so cryptic, it's hard to understand anything. Okay here's what I've found out...

418.30 (USPS?) tx'ing 24 hrs a day... have verified accounts at 12:30am 3am 10am 12pm

-1 base user - male, upper 40s-50s (must be putting out 25+ watts -- hear him perfectly)
-several mobile units (problem! they must tx on a shift I have no clue... refers to them by unit number, but I've never heard one yet!)
-have heard mention of 'a garage' ??? might be USPS
-have only heard them in certain areas like mine, Bellevue but can pick up in Renton & Federal Way. Never heard in downtown Seattle.

Any clues?

FOR SALE...
Yupiteru MVT-7100 Scanner

SPECIFICATIONS

Frequency Coverage: 530KHz-1650MHz, including full 800Mhz
Modes: AM, NFM, WFM, LSB, USB
Increment Steps: 50, 100Hz (LSB/USB only), 1, 5, 6.25, 9, 12.5, 20, 25, 50
100KH (100KHZ only on WFM)

Sensitivity:

0.53 - 2MHz
AM: Less than 10uV(S/N 10db)

2 - 30MHz
AM : Less than 1.5uV (S/N 10db)
LSB/USB: Less than 1.0uV(S/N 10dB)
NFM : Less than 1.5uV (SINAD 12dB)

30 - 100MHz
AM : Less than 0.5uV (S/N 10db)
LSB/USB : Less than 0.5uV (S/N 10dB)
NFM : Less than 0.75uV

1000 - 1650MHz
NFM : Less than 1.0uV (SINAD 12dB)

Memory Channels: 1000 (10 banks of 100)
Search Banks:10
Search Pass Channels: 500
Scan Speed: Approx 30 channels per second
Search Speed: Approx 30 steps per second
Delay: Approx 2 seconds (standard) or 5 second

Dimensions:644(w)x155(h)x38(d)mm
Weight: 320 grams
Antenna Connection: BNC Fitting

Supplied Accessories

4 x AA Nicad batteries, AC charger (12v DC, 200mA output), BNC telescopic
antenna, Belt clip, wrist strap

Yupiteru soft vinyl pouch with clear plastic windows over screen and
keypad.

Condition:

Radio has NEVER been used outside of the vinyl case and has no marks or scratches.

Radio is in MINT condition. I purchased the radio new from Javiation in the UK.

US $550.00

Please email if interested.

FOR SALE
Radio Shack PRO-62 handheld scanner

Specifications

Frequency Coverage:
30-54Mhz (in 5kHz steps)
118.0-136.975 Mhz (in 25kHz steps)
137.0-174.0Mhz (in 5kHz steps)
380.0-512.0Mhz (in 12.5kHz steps)
806.0-823.9875Mhz (in 12.5kHz steps)
849.0125-868.9875Mhz (in 12.5kHz steps)
894.0125-960.0Mhz (in 12.5kHz steps)

Channels:
200 Channels
(20 channels x 10 banks)
plus 10 monitor memories

Sensitivity:
(FM - 20dB(S-N)/N at 3kHz deviation):
30-54Mhz 1 micro volt
118-136.975Mhz 1mv
137-174Mhz 1mv
380-512Mhz 1mv
806-960Mhz 2mv
(AM - 20dB (S+N)/N at 60% modulation):
30-54Mhz 2 micro volts
118-136.975Mhz 2mv
137-174Mhz 2mv
380-512Mhz 2mv
806-960Mhz 4mv

Spurious Rejection: (FM at 154Mhz): 40dB

Selectivity:
+-10kHz: -6dB
+-20kHz: -50dB

IF Interference Ratio:
257.5Mhz at 154Mhz: 50dB
21.4Mhz at 154Mhz: 100dB

Scanning Rate: 25 channels/sec.

Search Rate: 50 steps/sec.

Priority Sampling: 2 secs.

Delay Time: 2 secs.

IF Frequencies: 257.5, 21.4, and .455 Mhz

Squelch Sensitivity:
Threshold less than 1.0mv
Tight (FM) 25dB
Tight (AM) 20dB

Antenna Impedance: 50 ohms

Audio Power: 180mW nominal
Built-in Speaker: 1 3/8" 8 ohm, dynamic
Power Requirement: +9VDC, 6 AA batteries
Current Drain: 95mA
Dimensions: 5 3/4 x 2 1/4 x 1 3/4 inches
Weight without antenna and batteries: 8.8 oz.

Accessories:

Antenna, belt clip, owner's manual

Condition:

Radio is two months old and in perfect condition.

US $200.00

Send email if interested.

> and searching.
>3. Poor sensitivity on shortwave, non-existent sensitivity on medium wave.
>4. Poor dynamic range - overloads easily. Included duckie antenna
> deliberately designed to be deaf, in an effort to control this.
>5. Poor battery life on internal, 300 mAH batteries. Once you start
> strapping on external packs, the miniaturization advantage is lost.
>In sum: good for "stealth" mode only (although the Alinco DJ-X1 might be
>better). Extremely poor choice as an "only" scanner, unless you live out
>in the sticks where signals are a few megahertz apart.
>

All true - except that some users may not experience some of these
problems if they do not live in a high RF urban area. Also, the novelty
of having full coverage combined with the small size and rugged
construction all some (like myself) to overlook some shortcomings.

Regardless of these problems, it may be the 'right' radio for some. I
like mine and wish I could keep it, but I need the money right now. One
reason I liked it is that it shares power accessories (packs, chargers)
with my ICOM HT.

So - if you are interested in one, be aware of these shortcomings, but
don't totally disregard this nifty little radio...

i have been doing t.v. and still news for some fifteen years and never have i heard on my ten scanners in the office or five out in the car about cops talking about where there are radar posts set up.

what they do is get their assigments from the traffic sergeant who gives them their radar guns and tells them in the police locker-room where their assigment will be. the only tip off will be when you hear a

traffic cop on duty and he tells dispatcher he is on special assignment and will there for an hour or more.

or you hear dispatcher say: "there's a motor set up at "e street" and would like to have patrol units keep a wide distance from the location ... meaning that there are to be few marked cars going into the area where the gun is being aimed...

as far as it goes... best is to just not go more than 5 mph over limit. usually radar cops don't go after you until you go 10 miles or more over.

the other option: use a chopper....

479. ADVICE: What scanner??

Newsgroup: rec.radio.scanner

I am concedering purchacing a scanner which will allow coverage of around 100khz - 1.3Mhz and am looking for some advice.

I hav e seen an ALINCO model (DJ-X1D), and I really like the look of it, as it is VERY small and compact.

I have also seen the YUPITERU (MVT-7000), however I prefer to the Alinco to its size.

Does anyone have any experiences with these scanners?? Any advice/experiences/ info about ANY scanner would be hugely appreciated

Regards

Jon

480. Re: New GMRS 10 Channel At Radio Shack

Newsgroup: rec.radio.scanner
Date: 1995-04-12 00:00:00 UTC
From: jmmorrison@aol.com
Message-ID: <3mgjr1$ek8@newsbf02.news.aol.com>
Source record: 258674

The PRS-101 is Radio Shack's new GMRS radio. All freqs are GMRS freqs between 462.550 and 462.750. The emergency is most likely 462.675. The radio transmits no PL and also can't be used with repeaters ---- a simplex, carrier squelch operation only.

This radio will have a hard time selling considering Maxon has a new 10 channel radio in which all GMRS freqs can be programmed into it by the user. Also, PL is selectable by the user. Finally, it does work on repeaters. I've seen it as low as $199 and for the price is a great deal for most GMRS users. The Maxon model number is 210+3.

Try using the RS window mount scanner antenna. It's deafness is not as bad
as a 20 db attenuator but will noticably knock down those intermod
and image problems significantly while maintaining goo overall performance.
I use one with my 2026.

> Matt S.

The best? They all stink to one degree or the other. Monitoring Times is little more than a front for Grove Enterprises, which publishes MT. It's poorly written and edited. Popular Communications has actually very little related to scanning. The rest of the rag is dull, written by what would seem to be old timers who are fond or remembering the glorious early days of AM radio. They pander to advertisers in reviews, like many other mags. I received a copy of US Scanner News (I think that was the name), which was also amateurish and not worth the $3.50 or so I paid for the sample copy.I think it has the best potential of evolving into a useful pub, however, since it is focused only on scanning. There's World Scanner Report, a newsletter, that has some very useful stuff in it but first you have to sort through Bill Cheek's blather and personal observations about a variety of irrelevant topics. I've subscribed to nearly all them all in the past year of so and I intend to let my subs lapse. Got better things to do with my money.

>(Uniden service number). They can advise you. The repair was handled
>very quickly.

Unfortunately, I had the opposite experience. I purchased a BC2500 from a dealer at a hamfest. I paid cash and I lost the receipt. I don't remember the name of the dealer, but he was a legal dealer. I contacted Uniden about the battery problem, they indicated I should send a letter, which I did. They answered with an order form for a battery at the retail price and said they would not handle the radio without a sales receipt. I had even xeroxed the back of the radio, showing the serial number. This was during the time period early enough that no warranty had expired on the 2500 as it had not been out long enough. I called and inquired - got the answer that this was the policy. It is the way we have always done it. I could get no other reason and I did not get any repair, mod, or battery. My opinion of the previously outstanding service from what used to be Bearcat is now at an all time low. Future buyers of Uniden products beware - the corporation is not customer oriented as it was in the past. Very disappointing. Anyone want to buy a used 2500?

The AR8000 from AOR recieves in SSB modes (USB/LSB), as well as
AM, CW, NFM, and WFM. It covers the 100kHz to 1950MHz range.
It is one of the few scanners that has true SSB mode. Actually
it would not need it aside from the fact that the radio
receives shortwave (i.e., below 30MHz), which includes CB and ham
radio bands, where SSB is commonly used for voice transmission.

In article <3md777$loe@newsbf02.news.aol.com> mfetto@aol.com (Mfetto) writes:

>For a 1/4 wave "marconi" [which has a groundplane, such as a car or ground
>radials], the radiator length = 234/frequency(MHz).

And I believe that formula (if correct) is for length in FEET.

Let's see what I get...

Speed of light is 2.9979 * 10^10 centimeters/sec.
To get feet per second, divide the above by (12 in/foot * 2.54 cm/in).
This gives a speed of light of 983,562,992 feet per second.
Divide this my 1,000,000 cyles per MHz and you get
983.56 feet per MHz for a FULL wave antenna. Since we
want a quarter wave, divide by four and get 245.89 (NOT 234).
I probably missed something. I suspect that the speed of
light (or RF) is a little lower in copper than in free space.

The radials also must be bent down 45 degrees from the horizontal
if you want to get close to a 50 ohm impedance. Kind of nice to
have if your receiver's input impedance is 50 Ohms (as is your coax).

That and speedtraps that use Aircraft. They can easily be heard and it
doesn't take a rocket scientist to figure it out.. I've found Laser sites
pretty easy to locate. The cops usually bitch to someone about how to use
it and how it isn't working.

It is illegal to 'intentionally intercept, use, or disclose
the contents of such a transmission unless you have the consent of a
party to the communication'. No exceptions are made for good
intentions.

How about this for a reverse sting...police use their cellular or
portable phone to plan a 'crime' and then charge anyone who reports the
information. Works for me!

It is also lower in the atmosphere which is where the 468 vs 492 is
derived from. 468/freq works best.

Yes, it's cut for 440, tuned for 440. Throw a network analyzer on it and
check out the repsonse below/above 440. That'll show you why it's a
poor out of band performer. The RS is a 'little' wider but nothing
to brag about, unless you're in an RF dense area, then it's
is great!

: What is the law? I heard there has been some change regarding portable
: phones.

In the US listening in on cellular conversations has been illegal since 1986. Listening to portable phone conversations was legal until Congress ammended to the privacy act of 1986. Now it is illegal to listen in on portable phone conversations as well.

In Canada it is legal to listen to cellular phones (and probably portable phones, too). That's why they caught the crooks that someone posted in a followup prior to this.

Also... Let me ask you guys another thing... Let's say I heard about something illegal if I listened to a cellular phone conversation and called it in to the police anonymously. Would they be able to use it in a court? I think it would be illegaly obtained evidence and therefore not admissible. Any lawyers out there?

Christian

----> begin included text <----

From: chucko@freud.arc.nasa.gov (Chuck Fry)
[1] Review of speed limit research [repost]
Nntp-Posting-Host: freud.arc.nasa.gov
Organization: NASA/ARC Information Sciences Division
Date: Tue Apr 20 12:21:04 EDT 1993
Lines: 271

This oldie-but-goodie reposted from my archives is a review of various
research articles about speed limits and their effect on driving safety.
If you wonder why I rail against the "Speed Kills" big lie, read on!

I recently asked the National Motorists Association for any literature
they had on speed limits and their effect on safety. Here is a brief
summary of the 5 papers they sent me. Quotations are without
permission; my advance apologies to the respective copyright holders.

Disclaimer: I am a member of NMA; I have no other connection with the
organization. Quotations are intended to summarize the intent of the
original author(s). Any opinions presented outside of quotations are
mine alone, and do not represent any organization's official position.
All typos are mine unless otherwise noted.

The articles read were:
- Warren, Davey L., "Synthesis of Speed Zoning Practice", Report no.
FHWA/RD-85/096, July 1985;
- Tignor, Samuel C. and Warren, Davey, "Driver Speed Behavior on U.S.
Streets and Highways", in Institute of Transportation Engineers
Compendium of Technical Papers, 1990;
- Harkey, David L., Robertson, H. Douglas, and Davis, Scott E.,

"Assessment of Current Speed Zoning Criteria", preprint of the Transportation Research Board 69th Annual Meeting, 1990;
- National Highway Traffic Safety Administration, "The Effects of the 65 mph Speed Limit Through 1989: A Report To Congress", December 1990;
- Lave, Charles A., "Did the 65 MPH Speed Limit Save 3,113 Lives?", UCI-ITS-WP-90-4, University of California at Irvine, August 1990.

The first three papers suggest the following conclusions:

(1) Speed limits are influenced less by safety concerns than other factors.
(2) Most drivers seem to know what is a safe speed for conditions, and drive accordingly, irrespective of posted limits.
(3) As a consequence of (1) and (2), nearly everyone speeds.
(4) Slow drivers are involved in crashes much more often than fast drivers.
(5) The slowest drivers tend to take out other cars when they have accidents; the fastest drivers tend to have single car accidents.

The NHTSA and Lave papers have conflicting conclusions. Naturally the NHTSA says "fatality rates are up on 65 MPH roads"; Lave says "yes, but overall fatality rates are lower because of 65 MPH".

Hit 'n' now if you want to skip the details.

- Warren, Davey L., "Synthesis of Speed Zoning Practice", Report no. FHWA/RD-85/096, July 1985.

This two-pager is a preview of the Tignor and Warren report described below. Many of the key points are the same.

"Some of the problems found with current speed zoning practices include:
o Lack of understanding and support for current speed zoning criteria.
o Difficulty of using other factors such as road characteristics and accident experience in conjunction with prevailing speed.
o Public pressure based on concern about past accidents.
o Concealing radar and obtaining speed samples on low volume roads.

"Traffic officials generally agree speed limits should reflect the speed of most drivers. All States and most of the local agencies use the 85th percentile speed of free flowing traffic as the basic factor. However, it is fairly common to reduce the speed limit based on a subjective consideration of other factors."

"Based on the best available evidence, the speed limit should be set at the speed driven by 85 to 90 percent of the free-moving vehicles rounded up to the next 5 mph increment. This method results in speed limits that are not only acceptable to a large majority of the motorists, but also fall within the speed range where accident risk is lowest. Allowing a 5 MPH tolerance, enforcement would be targeted at drivers who are clearly at risk.

"No other factors need to be considered since they are reflected in the drivers' speed choice. If there are unusual hazards not readily apparent to drivers, then a warning sign could be installed giving the nature of the hazard and, if necessary, supplemented with a realistic advisory speed."

Figure 1 shows a plot of accident risk vs. relative speed, revealing a bathtub-shaped distribution of speed vs. accident involvement. A more detailed version of this chart is included in Tignor and Warren.

- Tignor, Samuel C. and Warren, Davey, "Driver Speed Behavior on U.S. Streets and Highways", in Institute of Transportation Engineers Compendium of Technical Papers, 1990.

This is the paper that was excerpted in Car and Driver some months back. Its contents will be familiar to any reader of that magazine.

Figure 4, omitted here and in the magazine article, is of particular interest. It is a plot of single-vehicle and multi-vehicle accident involvement rates against percentile travel speed. It shows that the slowest 5 percent of drivers are more than 9 times as likely to be involved in multi-vehicle crashes compared to the average of all drivers (NOT drivers at the average speed) and 3 times as likely to have single-car mishaps, while the fastest 5 percent are about 3 times as likely to have single-vehicle accidents and only average involvement in multi-car crashes. Accident involvement is roughly twice the average for the 5 to 30 percentile range for both types of accidents.

The following paragraphs are noteworthy:

"Properly established speed limits foster voluntary compliance and separate the occasional high risk driver from the vast majority of drivers. On the other hand speed limits which are set artificially low tend to be ignored and misallocate resources, apprehending and prosecuting motorists driving at safe speeds. Over time this could lead to a loss of respect for all speed limits and create the impression that traffic law enforcement and the judicial system are unfair. The same public when emotionally aroused demand and often get reduced speed limits by believing the lower limit will slow down traffic and reduce accidents."

"Driver compliance with speed limits is poor. On average, 7 out of 10 motorists exceeded the posted speed in urban areas. ... Compliance tended to be worse on low speed roads, better on roads with prima facie limits, or where the speed limit was based on an engineering study. Better does not mean good compliance; less than 10 percent of the sites had more than 50 percent obedience with the posted speed."

"The accident involvement rates on streets and highways in urban areas was highest for the slowest 5 percent of traffic, lowest for traffic in the 30 to 95 percentile range and increased for the fastest 5 percent of traffic (Figure 4) [omitted -- Chucko]. ... The risk curve illustrated in Figure 4 for roads in built-up areas is consistent with the work of Solomon, Cirillo, and West and Dunn which showed that the risk of

involvement in accidents is minimum near the average speed of traffic and increases dramatically for vehicles traveling much slower or faster than average. ..."

"Many current speed limits coincide with 30 percentile speed which is near the lower bound of safe travel speed. Speed limits should be set in the 70 to 90 percentile range or roughly 5 to 10 mi/h abouve the average speed to correctly reflect maximum safe speed. ... Allowing a 5 mi/h tolerance, enforcement would then be targeted at drivers who are clearly at risk."

"... [T]he findings to date suggest that, on the average, current speed limits are set too low to be accepted as reasonable by the vast majority of drivers. ... The posted speeds make technical violators out of motorists driving at safe and reasonable speeds."

- Harkey, David L., Robertson, H. Douglas, and Davis, Scott E., "Assessment of Current Speed Zoning Criteria", preprint of the Transportation Research Board 69th Annual Meeting, 1990.

NMA sent only the one-page summary of findings from this paper, reproduced in its entirety below. Note in particular the last sentence.

"The analysis of travel speed, compliance, and accident risk produced the following significant findings:

o Mean speeds exceeded the posted speed limit by 1 to 8 mi/h.
o 85th percentile speeds ranged from 6 to 14 mi/h over the posted speed limit or 4 to 7 mi/h over the mean speed.
o Cars travel 1 to 5 mi/h faster than trucks for all speed zones.
o There was no consistent increase or decrease in speeds based on time of day across all speed classes.
o The majority of drivers observed (70.2 percent) did not comply with posted speed limits.
o Overall, the percent of drivers exceeding the posted speed limits by more than 5 mi/h was 40.8 percent, by more than 10 mi/h, 16.8 percent, and by more than 15 mi/h, 5.4 percent.
o In general, 85 percent compliance was achieved at speeds 10 mi/h over the posted speed limit.
o The data indicated some reluctance by drivers to speed excessively on higher speed roadways.
o Noncompliance was higher for cars than for trucks at all levels.
o It appears that excessive speeding (more than 10 mi/h over the posted speed limit) is more prevalent at night.
o Accident rates for the 25 mi/h zones were consistently much higher than for any of the other zones.
o In contrast to the national trend, the night accident rate was consistently lower than the daytime rate.
o The speed at which accident risk was minimized occurred at the 90th percentile of the travel speeds observed."

- National Highway Traffic Safety Administration, "The Effects of the 65 mph Speed Limit Through 1989: A Report To Congress", December 1990.

The NHTSA's analysis concentrates solely on those freeways where speed limits were raised to 65 MPH. Not surprisingly it finds that total deaths increased when speed limits were increased.

"The number of fatalities that occurred in 1989 on rural Interstates in those states that increased their speed limits in 1987 is 31 percent greater than would otherwise have been expected based on historical trends. This is equivalent to the difference reported for 1988, and suggests that effects of the 65 mph speed limit may have stabilized.

"The results, after accounting for travel on rural Interstates, suggest that about one-third of this change resulted from increased travel after the speed limit was raised, the remaining two-thirds (10 percent in 1987, 22 percent in 1988, and 19 percent in 1989) being associated with the change in speed limit."

"... It should be noted that many states experience so few rural Interstate fatalities that large yearly changes in their number can occur solely as a consequence of chance. Thus, the experience of individual states is not likely a barometer of the nation's experience as a whole."

- Lave, Charles A., "Did the 65 MPH Speed Limit Save 3,113 Lives?", UCI-ITS-WP-90-4, University of California at Irvine, August 1990.

This article purports to be a statistical analysis of accident rates before and after the Federal government allowed states to raise rural freeway limits to 65 MPH. Using the NHTSA's own numbers from its 1989 report (the year previous to the above), it counters the agency's conclusions by concluding that the increased speed limit *saved* an estimated 3,113 lives in 1987 and 1988. The author appears to have an axe to grind, and uses most of a page to defend his statistical methods, but raises some interesting points:

"Although the federal government has no direct power to set speed limits, it was able to do so indirectly through financial pressure. ... Given such financial pressure, it is reasonable to suppose that state governments might ask their highway patrols to give special attention to enforceing speed limits so as to generate favorable compliance-statistics. In turn, this might cause highway patrols to concentrate their resources on the interstate highways since these highways have the densest concentration of high speed traffic, and hence a patrol-hour of activity there will control the greatest number of potential speeders. On the other hand, the interstates are only a small proportion of the total highway miles and they were already the safest roads in the state. So it is not obvious that overall safety would benefit if patrol resources were taken from other duties to control speeders on the interstates."

"... The National Research Council's commission to study the effects of the 55 mph limit heard testimony on this point. The commission asked

highway patrol officials from a number of states to think about the following situation: suppose you were permitted to change your manpower allocation in any way you wish, would you leave the allocation as it is now? Some state officials wanted to devote more resources to dangerous roads and dangerous activities such as drunken driving, justifying the change in terms of reducing overall fatalities. Other state officials, perhaps suspicious of the political implications of such a question, simply answered: No, 55 mph is the law, and it's my job to enforce the law. In its final report, commenting on the allocation of highway patrol resources in 1984, the NRC commission said: 'This (existing) allocation, however, is not entirely optimal either from the standpoint of total travel on these highways, or total motor vehicle deaths.'"

"... Prior to the imposition of the 55 mph limit in 1974, we would have expected many drivers to go out of their way to use the high speed interstate highway system. After the new limit was passed a driver choosing between a 55 mph rural interstate and a 55 mph country road was more likely to select the scenic route. We would expect a similar effect for urban interstates. Likewise, with patrol resources concentrated on the interstates, it is likely that at least some drivers selected non-interstate highways because of the chance to drive faster than 55 mph without the danger of being caught. ... Viewed from a safety perspective, these motivations cause a misallocation of traffic, moving it from safe roads to dangerous ones."

"The misallocation of traffic and the misallocation of police resources combine to systematically overstate the safety effects of the 55 mph speed limit on the interstate highways. The extra policing resources on these roads lowers the fatality rate below what it would be with a 55 mph limit and a normal amount of policing. And the artificially decreased traffic volumes on these roads obviously lower the fatality rate too."

514. An AR 2500 story.

Newsgroup: rec.radio.scanner
Date: 1995-04-12 00:00:00 UTC
From: Jan Waechtler <u7224ao@sunmail.lrz-muenchen.de>
Message-ID: <3mheuk$8pu@sunserver.lrz-muenchen.de>
Source record: 258708

I'm just wondering if anyone has made similar experiences with the AR 2500 (I think now it is called the TR 4500 ?) as me. 4 years ago I bought one. When I first played with it the tuning knob did not allow me to tune upwards. I called ACE Communications from who I bought this unit, and they told me that it was a software bug that would be solved in three weeks. Needless to say, it wasn't solved and I ended up returning my unit because I figured that if I spend that much money, I expect EVERYTHING to work. Two years later, I decided to buy one again (I guess I didn't learn my lesson...) since I figured that they surely must have fixed the problem. To my surprise, the tuning knob still didn't work ! On top of that, after 5 minutes of receiving, the unit just stopped working. That made the decision easy to return the unit and never consider anything from that company again.
I find this very unfortunate though, because for the few times the receiver worked, it performed extremely well. Is there anyone who has made similar experiences ? Or as a matter of fact, is there anyone who has a AR2500/TR4500 receiver ? I'm asking this because I never heard/read any comments on this unit.
I now have an RS-2006 which I quite like, but I don't think it performs as well as the AR2500, and it has a smaller frequency range and less options.

516. Antenna: dipole length?

Newsgroup: rec.radio.scanner
Date: 1995-04-12 00:00:00 UTC
From: lerman@saucer.cc.umr.edu
Message-ID: <3mhi46$8al@hptemp1.cc.umr.edu>
Source record: 258710

I am interested in constructing my own dipole antenna at home, and I was wondering how to figure out the best lengths for the elements. I hope to use about 20 feet of RG-58 cable to connect it to my scanner. My main questions are:

What is the number I should use to divide the MHz by to obtain element lengths? I think it is 2250, but I am not sure.

Will trees affect reception of this type of antenna in the 150-158 MHz range? This antenna will be dirctly underneath several rather large oak trees.

I will most often be using this antenna to receive on the Low and High VHF bands.

Thanks,

--

|> Where can I buy the CHannel Master Moni-Tenna?
|> What range does it cover?
|> Any gain?
|> Thanks for the help!
I bought mine from a business electronics supplier and I would assume a similar outfit near you would have them or order them.

The Moni-Tenna is tuned to five different public service bands--can't remember exactly--around 30MHz, 150MHz, 450MHz, 800MHz, oh and aircraft.

I have mine mounted on the roof of my apt. bldg. and the gain appears to be substantial. I pick up all State Trooper activity in my half of the state, 450MHz police from over 50 miles away, 800MHz from almost as far. It doesn't appear to be too directional. It doesn't work well on military aircraft.

Mine cost $34.95 and came with 50ft of good cable and a stand-off mounting system. I would recomend it.

The 200, 2500, and 3000 battery packs (and probably others) have a built in
current limiter so you can plug in any 12v source without worring about
melting the batteries.

The Webster Tx police will give their call sign and location for radar set-ups with the line: "6-29, out at 20200 I45 for a second job" living in the area and riding around with my scanner I know 20200 is a overpass address not a business. When they really have a second job thay say "6-29 10-7 at Venture for a second job until 2:00pm". Sometimes they will go to their second channel (which I have :-) and talk about radar locations...

If you scan long enough, you'll figure it out. No such luck with Houston PD they have secure channels... :-(
Scan on !

My recollection is that the so-called "charge circuit" consists of a diode
and current-limiting resistor. If you want more wallop, just replace the
resistor (it should be easy to find) with one of smaller value.

From: jmmorrison@aol.com
Message-ID: <3mj8cv$4f1@newsbf02.news.aol.com>
Source record: 258553

If your police dept is on a trunked system there's a 99% chance that a digital PL decoder will not help you. Trunked systems change freqs based on commands passed by the controller, not by subaudible tones.

I've got a PL/DPL decoder and the only subaudible tone present is one of 107.2 on all of the input freqs.

Radio Shack and realistic are the same company basically. Realistic takes
it's name and puts it on products of other comanies and sells them for
more. Take apart a pro51 and you will see that it is actually a Uniden
scanner with Uniden parts.

I have a R1, and I love it, its compact, very well built and provides decent reception. My only complaint is the squelch doesn't cover the full range, sometimes a very weak signal can cause the unit to stop on that channel during a scan and you must manually skip the channel (or you can write it into skip memory, but you must remember to enable that channel later). I've never seen an AR8000, but from what I've read in this newsgroup its seems to be really cheaply made and I've heard of reports of new units with defective switches and keypad labels wearing off. Those types of problems don't exist with the R1.

Rick, (and the rest of the group)

If you use stereo headphones with your scanner, you'll only hear sound out of one earphone. Buy a mono headset. RS has inexpensive ($10-$15) mono headsets with the right jack for your scanner.

Happy scanning,

Ken

Pro34 Mods

Remove the four screws from the back of the unit, then remove the batteries. Gently remove the back cover from the unit. You will need to de-solder the antenna from the top board. Then remove the nuts holding the squelch and volume pots. There may be a wire at the other end of the top board to de-solder, which I think is mainly for grounding purposes. Then, there are four hex screws holding the top board on. Remove these and carefully wiggle the top board loose from the bottom. I say wiggle because there is a multi pin connector to unhook. Once unplugged, slide it out horizontally so that the volume and squelch pots slide out with the board. Then there are three screws to remove to lift the metal shielding from the bottom board. Once you have the bottom board in plain view, you should see D9, D10, D11 and D12 on one side of the board. Cut one lead of D11 and seperate the leads so they dont touch. This removes D11 from the circuit and adds the 800 mhz cellular phone bands to your scanner. It is a hassle to get to D11, but the added frequencies are worth it in my opinion. Of course, LISTENING TO CELLULAR PHONE CALLS IS ILLEGAL! There are other mods that do various things to the diodes but these mods are of little value. One, for instance, adds the 66-88 Mhz band but it also removes the 30-54 Mhz band at the same time. In addition, many units won't even pick up anything in the 66-88 band without major realignment. I know mine won't! There is one other mod that's worth doing. I can't remember the part designation, but there is a ceramic 2 Mhz crystal on the logic board (probably blue in color), near the main CPU You can replace it with a 3.4, 3.55 or similar value for increased scanning speed. If you go over 4 Mhz, your CPU *may* not be able to maintain its integrity. If you use a normal crystal, you'll have to bend the leads over and lay the crystal flat over a nearby chip. It will fit though and it works! Make sure the crystal leads and the crystal body are insulated from touching any other circuits. If you use the two second delay, it will be affected by the crystal. The delay time will be reduced by increasing the crystal frequency. When you put the unit back together, make sure the key lock switch is intact. Mine fell out and I didn't notice it was missing until I had everything back together.

Also, don't get the antenna connection too awful hot. There is a surface mount cap near the underside that will fall off if you apply too much heat. This is the input cap from the antenna. You'll notice decreased signal strength after you put it all together again. It can be a real bear trying to put surface mounted parts back on the board!! Trust me ;-)

Have fun. If you really screw up your radio, it's NOT MY FAULT !!!!!!

:>Mike

Ham bands above 30MHz also feature SSB, especially 144 Mhz,
and 432 MHz and sometimes 1296MHz and higher. Ham satellites
use it on these frequencies as well as terrestrials, but you
need a decent beam aerial (a few elements say).

>poor out of band performer. The RS is a 'little' wider but nothing
>to brag about, unless you're in an RF dense area, then it's
>is great!
>
Yes, the antenna will respond better on some frequencies than
other. But intermod' is not a function of the antenna, but a function of the ability of the
receiver's front end and mixer to reject reception of two signals which differ
by the IF. If anything, the Larson should make my intermod problems worse
on the 440 MHz band (which it is), and less a problem on the 150 and
800 MHz bands (which it is), verifying your point.

My inquiry is still: does anyone know if the Bearcat version of this scanner
add a tracking front end to try to knock down the intermod problem?

Another PRO2026A owner here at work concurs that he's getting terrible
intermod' problems too. As he whimsically commented, "Why bother with
the cellular phone mod'--I hear them just fine without it!"

My other receivers such as my PRO2004, RZ-1, and R7100 do not suffer as
badly--probably because they employ more selective filtering prior to the first
mixer (or, in the case of the RZ-1, it's just deaf as a doorknob).

A look inside the PRO2026A revealed that the antenna just comes in, goes
through some not-so-impressive LC circuits (I think), then straight into the first mixer.

Great RF performance. No selectable banks for storing frequencies. User interface is a weird (like most Icoms). Nice small size, nice display, nice feel. No SSB for the SW range. Good audio. Multiple antenna inputs is nice. Expensive.

Overall, if you dont mind all your freqs in one bank and the slightly cubersome programming sequence, it is a great receiver.

The ramsey decoder will not work. It is only for speech inversion scrambling.
There is no way to decode the digital transmissions. Unless you are a very
good hacker and can figure out the digital format. If DES or other scrambling
is being used, forget it.

I just want to be crystal clear on this as it was always a bit cloudy to me... but is it illegal to just LISTEN, or to REPEAT (reproduce, tell anyone about, etc...) what you heard? In other words if I'm just sitting alone one day with my scanner and I hear a cordless phone conversation - I'm breaking the law? I was always under the impression that the airwaves are open to the public, yet if I repeat or even worse TAPE the conversation and play it back to someone, play it at parties, rebroadcast or transmit it, make a CD and call it the "Jerky Neighbors" - THEN - it was illegal.

If it's so illegal just to LISTEN, why do they even include that frequency range on a scanner to begin with?

As a Ham in Michigan, I carry a copy of the applicable law in the
car with me ALWAYS. The actual law was modified in 1990, and reads
as follows:

Enrolled House Bill No. 4750

Section 1. Section 508 of Act No. 328 of the Public Acts of 1931, being
section 750.508 of the Michigan Compiled Laws, is amended to read as follows:

Sec. 508 (1) Any person who shall equip a vehicle with a radio receiving
set that will receive signals sent on frequencies assigned by the Federal
Communications Commission of the United States of America for police purposes,
or use the same in this state unlesss such vehicle is used or owned by a peace
officer, or a boina fide amateur radio operator holding a technician class,
general, advanced or extra class amateur license issued by the Federal
Communications Commission, without first securing a permit so to do from the
director of the department of the state police upon application as he or she
may prescribe shall be guilty of a misdemeanor, punishible by imprisonment in
the county jail for not more than one year, or by a fine not more than $500.00
or by both fine and imprisonment in the discretion of the court.

(2) This section shall not be construed as restricting the use of radar
detectors.

--end quoted law--

This leaves novices out in the cold. This posting is not guaranteed for
spelling accuracy, and should not be used for legal advice. See the
proper legal journals for texts and case law. The poster makes no
warranty expressed or implied towards the accuracy of the material
contained herein.

With that out of the way...the best advice is to use your head.

>>
>>Anyone else tried to do this?

It's really very simple if you have access to the wiring on the 'earphone' jack. Somebody already mentioned that it is a -physical- disconnect. When the earphone jack is plugged in, it pushes two layers of metal apart, which breaks the line to the speaker. Simply locate the wires that go to each piece of metal, clip 'em off and attach them together. That's it. There's absolutely nothing you can do to damage the radio by doing this, unless, of course, it's still under warranty - in which case I would follow the several other suggestions about making a plug that splits into two outputs; one going to some amplified speakers and the other as your 'line out'.

If you clip the wires, you might consider installing a switch on them so you at least still have the opportunity to kill the speaker if necessary. You might also consider putting a potentiometer (volume control) on the 'line out' to control the output level as it's really much higher than a real 'line out'. Also of course keep in mind that your real volume control will change the 'line out' level as well as your speaker.

I would suggest the large muf type headphones used for home stereos. This will help reduce the outside noise. I used this type when I went to time trials. You can purchase a mono adapter at Radio Shack.

> Mr Yanek,
> Your advise is well said, the cops dont' like scanners !

Thank you,... but it's Ms.

My real point wasn't so much that they don't like them, (they don't) if they're not illegal where you live, it's irrelevant. Just like they don't like me showing up w/my camera's,and taking their picture, but they have to live w/it. On the other hand if they're illegal in your state they will confiscate it.

But rather, that all the police in my part of the country (Greater Cleveland Area), just don't broadcast their locations while on traffic duty. They usually do once they stop someone, so the dispatcher knows where they are if they get into trouble, or aren't heard from in awhile, and so there backup can find them.

Given this, it would seem that if you are going to invest a couple hundred bucks for a device to detect the prescence of traffic enforcement, a radar detector is *more* reliable. Even though it can be useless too, if they're running time/distance on you.

> I haven't heard about "aim for the plates" before. Tennessee doesn't
> require a front plate and Lord knows I and others here get stopped .

Ohio does require one, not particularly for this reason, but the police I know have told me that factory reps for the equipment, that trained them recommend the front plate as a target. Ohio though, does have exceptionally reflective plates (almost like those reflective road signs)

> This caused an additional thought. I've learned that only with rare

> it has to do with not getting an accurate "hit" with the gun for lack of
> the front plate? Any thoughts there?

Cops seem to be of the attitude that everyone should be given about 10 mph before being written (otherwise you're just being a prick) It seems to have more to do with the fact that not every speedometer is the same on every vehicle, and there are inherent inaccuracies in them. They also seem to think it's just being sporting. A good friend of mine says he never writes anyone under 70mph. He feels it's a waste of effort, because some

clown will certainly come along in a few minutes, that he can write for 75 or 80 mph. They've had this attitude long before lasers even came out.

Also judge's (municipal at least) will question tickets like "42mph in a 35 Zone." It's more common to see these kind of tickets in smaller towns w/mayors courts or the such, rather than cities w/municipal judges. Tickets like these are an indication of a city using traffic enforcement *specifically* as a form of revenue, which is against our state laws. Our State Legislature here in fact,
just passed a law that no city w/out at least 1-on/exit ramps, and at least 1 mile of the highway travelling through it's borders, may engage in traffic enforcement on a state owned highway, unless they become involved with the vehicle for some other reason 1st. This was in direct response to a small notorious suburb here that achieves something like 70% of its city budget, by writing such nonsense tickets.

> My advise would be drive 8-9mph over the limit and use your EYES & COMMON

I've driven right past, and right along side Ohio State Troopers (infamously strict) at 65mph. They might give me a look, and stay level with me to be intimidating, but they don't seem to be interested in stopping me. I think, they think, I must be seeing 55-60 on my speedometer. (who would be crazy enough to speed alongside a cop!) And I guess they just figure it's close enough for them,
because I've never (knock on genuine imitation wood!) yet been stopped for it.

But since we've drifted far off the subject of rec.radio.scanners. I'd better stop.

570. Re: Antenna: dipole length?

Newsgroup: rec.radio.scanner
Date: 1995-04-13 00:00:00 UTC
From: mikelder@aol.com
Message-ID: <3mkfck$e10@newsbf02.news.aol.com>
Source record: 258583

formula is freq/468 for a half wave dipole. The 2-meter ham band is from 144-148 mhz and any 2-meter antenna should give good results. A 2-meter dipole is approx. 19 inches per side. That is 38 inches total length cut in the center and fed with coax. Center conductor on one side and shield to other.
Radio Shack has a downright reasonable antenna that would be excellent for the frequency range that you describe (ie. less than $20.00). Small, lightweight
and unobtrusive. Sorry, but i cant find the damn radio shack catalog. Maybe i will get back to you. It is easy to find tho, it is a ground-plane type antenna.
One element approx. 20 inches long vertical and three in the horizontal plane.
It also has 2 short (6inches) rabbit ears going vertical at 45 degree angles.
If you cant locate it leave me a message and I'll get back to you with part no.
It is $16 or $17 dollars. Simple and kinda neat. Just put it up in a tree as high as you can and as much in the clear as possible (ie. as far away from any metal as you can). If you have a coax run more than 50 feet or so go with rg-8 type of coax otherwise the rg-8x type is cheaper, easier to work with and entirely sufficient. A 2-meter pre-amp from Ramsey should really work wonders with it also.

>
> or you hear dispatcher say: "there's a motor set up at "e street" and
> would like to have patrol units keep a wide distance from the location
> ... meaning that there are to be few marked cars going into the area
> where the gun is being aimed...

It seems clear at this point that different police departments, in different parts of the country, may have different radio traffic procedures.

Here in North East Ohio, *most* departments don't have a seperate traffic division. Traffic enforcement is usually incidental/in addition to their other calls. The only city I can think of here that might go about it in the above manner is Cleveland, and I don't listen to their traffic enforcement channel.
Their zone cars do traffic too, but the only time you hear their locations is when they answer the dispatcher when being called, or when (like I said) they're stopping someone, or asking a plate to be run etc.

My initial point was that a scanner, is not as reliable a device to detect the presence of a speed trap, as a radar detector. Am I being over-sensitive? I haven't seen that disputed yet, or am I being a blonde again?

Jamie-Andrea Yanak

P.S.

E-mail me bobcon, I'd love to compare notes on touchy cops, who are allergic to camera's.

Try a radio shack (or similar) discone antenna for 90-900 mhz (approx) coverage. I have found that if you remove the plastic cap on top and get a 6 or 7 foot piece of aluminum tubing slotted on the end and attached with a hose-clamp on top it will really help the lower freq. coverage. For more info please leave me a message. I use a 5 foot piece of tubing on top of mine for cordless and it really does a good job. Although not as good a an antenna for each band that you wish to recieve, it makes an excellant comprimise antenna for all bands. I do not relish the thought of putting up an antenna for each band although that is by far the best route to go. A resonant antenna will tend to help reject out-of-band interference. If you have one particular band that you want to recieve, then a separate antenna will help a lot. I have a discone on top of a tower and dont want to put up a tower for each band. A vertically polarized antenna will usually be put on top, and remember the rule height is EVERYTHING.

Jon,

The units you listed are decent units, but past experience (and other users)
should tell you that you can't be all things at once. My point is that while the
freq coverage on these units is emmence, performance & selectivity will suffer.
I' suggest two sources of scanners and info: 1) Radio Shack, good products and a 30day satisfaction gaurantee (you may have to push the issue) and you can touch/feel unit before buying. 2) Grove catalog (800-438-8155), super
people, mulitple lines, great tech support, liberal return policy, honest advise.

Regards from Memphis, G.W.

Mr Yanek,
Your advise is well said, the cops dont' like scanners !

I haven't heard about "aim for the plates" before. Tennessee doesn't require a front plate and Lord knows I and others here get stopped .

This caused an additional thought. I've learned that only with rare exception will any State or Local unit in Tennessee even cite a driver unless they are 10mph minimum over the limit. They say this eliminates the arguements at the Judge's bench as they would be clearly over to be cited at all. But maybe
it has to do with not getting an accurate "hit" with the gun for lack of the front plate? Any thoughts there?

My advise would be drive 8-9mph over the limit and use your EYES & COMMON SENSE to avoid a ticket, relying on a detector cost me on two occasions, none since trusting my own judgement.

Save your money for a better radio, G.W.

578. 6 Meter Mod for Bearcat 210 Scanners

Newsgroup: rec.radio.scanner
Date: 1995-04-13 00:00:00 UTC
From: leigh@rain.org
Message-ID: <3mi4ri$mfk@news.rain.org>
Source record: 258591

Following is a copy from Packet, on how to expand the low-band VHF range for the Bearcat 210 and 211 scanners. A friend has tried it on his 210, and says it works well. The author implies it will work on other older Bearcat scanners, but it did not work on another friend's BC-300.

My acquaintance says his BC-210 has excellent low-band VHF recieve, and he was delighted that he can now hear 6 meters with it. I've not yet found out how far above 6 meters it will go.

73. --Leigh/KM6JE.

59074 B# 2314 MODS KK5JY ALLUS 950410 6m for older Bearcat scanners

Hello ALLUS! Many older Bearcat scanners do not have the ability to go into 6m. Well, I came across a little trick that can make your Bearcat 210, 211 or similar scanner scan 6m and beyond.

1. Select a blank channel. You will lose whatever frequency is in this channel.
2. Type 50 [LIMIT]
3. Type 50 [LIMIT]
4. Type [SEARCH] (display blinks 50.000)
5. Type [HOLD] (display shows 50.000)
6. Type [MANUAL]
7. Type 144 [LIMIT]
8. Type 143 [LIMIT]

At this point, the dislpay shows "Error." This is normal. Press [SEARCH], and after a 1-2 second delay, the scanner will begin a search starting at 50.000MHz and will continue to 144MHz (minus a few segments) before looping back to 50. I have tried this on several older Bearcats, and found only a few which were incapable of accepting this mod. This won't mess up your scanner. If it doesn't work on your model, it just doesn't work. Nothing changes one way or the other.

Enjoy!

Call Amateur Electronics Supply (Milwaukee, WI, (800)558-0411).
They sell it and it appears in the AES catalog.

Sorry, I looked for, but didn't find the specs, but the 5094A Monitenna
covers the VHF-lo, VHF-hi, UHF, and 850 MHz bands.

The older, discontinued 5094 was not designed to cover the 850 MHz band.

Surprisingly, Channel Master responded to my request for more
info by sending me a radiation pattern plot for which
showed the pattern for each band. Looked pretty good, if I recall.

Now, where did I put that darned plot? :-)

LU>I find it hard to believe that you are a "professional installer" if you
LU>think that a cellular phone antenna will work with a scanner. Yes, both
LU>are available in glass-mount types. Yes, both glass-mount types are
LU>black. But the similarities end there. A scanner glass-mount antenna is
LU>not only longer but has a completely diffenent cabling and plug.
LU>Daryl

They work great here in Toronto, almost everthing of value on 800 mhz
trunked systems! Whats different about the cable? As for the rf
connecter, not a plug, one simply changes it to a bnc or buys an
adaptor!

Dan

591. Realistic PRO 2005 problem?

Newsgroup: rec.radio.scanner
Date: 1995-04-13 00:00:00 UTC
From: Cliff_C._Hatcher@mail.magic.ca
Message-ID: <1995Apr13.165508.8529246@mail.magic.ca>
Source record: 258604

I have a a Pro 2005 scanner which has a problem receiving strong signals. When I tune in a freq. which is strong, such as an FM radio broadcast, the reception is choppy and broken. When the DJ is speaking parts of the words are missing. Has anyone had similar problems or can suggest a remedy for this problem. I spoke to one person who suggested it may be something called "clipping". Is this a major expense to repair, of a minor adjustment under the hood.

A schematic diagram for the thing would also be appreciated.

Thanks,

Cliff

592. finding HIDDEN freq.

Newsgroup: rec.radio.scanner

Hi there!

Can anybody out there tell me how to find hidden/not listed
frequencies? I listen to the police band in Windsor, Ont., Can.
Every so often I hear them say "go to channel 5".

I can't seem to find this channel, does anyone out there know
what it is, or how/where to search for it?

Thanks for any help received.

Hello Darren,

Well I'm not sure what I have for Hawaii but I'll try and look around
here and see what I have. Currnetly I'm on a 7 day free current under
Interramp, so thats why I put my work E-mail address:
kstein@mgtsys1.hq.nasa.gov. Please respond to that address since I'm only going
to have this address for a week.

I have several frequency directories here and I'll see what I have for your
area. Talk with you soon, bye.

Sounds like the EL panel burned out, a common problem with the 2004/5/6
series. Basically, the panel slides behind the LCD. With some special
mixtures of chemicals and AC voltage, the panel lights up. However, the
display will dim and occasionally not light up any more after use. The
part number is GE-88D-7738 and can be ordered through RS or Tandy Ntl.
Parts at 1-800-THE-SHACK.

Jerry

Hi Brian - you didn't say where in Md. you were going, but here is a list to keep you busy:
Md. State Police - HQ main 39.10
other HQ 39.26
39.24
39.34
39.62
MSP coordination w/Baltimore cty: 39.56
barrack to barrack: 155.19
mobile extenders : 155.73
MSP troop letters are in parens:
Northeast (F) 39.84
Belair (D) 39.92
JFK/Perryville (M) 39.24 rptr on 151.04
Golden Ring (R) 39.44
Glen Burnie (P) 39.04

Dept of Transport/Emergency tfc response: 47.32
in Anne Arundel County, mobiles: 47.26
in Baltimore county, mobiles: 47.40
Metro Traffic Control : 450.4875

Both Baltimore and Anne Arundel counties have extensive 800 mhz systems. 8xx = 856 thru 860 mhz

Baltimore cty: 8xx.2125 8xx.7125
8xx.4625 8xx.9625
Note: 857.2125 thru 860.2125 are data/hskp channels
one frequency in the .9625 group is rotated every 24 hrs for data/hskp.
Secondary system: 854.0125 853.4125 853.0125 854.5625
(trunked) 854.0375 853.0375
Fire dispatch relay: 46.46
Fire/Hazmat/Medevac coordination: 46.28
(whoops, I forgot Medevac/Syscom is on 44.74)

Anne Arundel cty: 8xx.3625 8xx.3875 8xx.4125
Note: 8xx.4125 group are data/hskp channels
Fire dispatch relay: 154.01

And now for Baltimore City (is that where you're going?)
City wide: 453.2 453.3 453.65
TAC : 453.975
Radio shop/maint (also TAC from time to time): 460.525 460.55
SHA/Highway: 453.7
City North: 453.825

Northeast: 453.525
Northwest: 453.925
West: 453.625
Central: 453.425
(I assume here you are headed to the Inner Harbor, coming
down from Ct. north)
Fire: dispatch 154.31 154.415
EMS : Med 9,10 calling Med 2,3 working

601. trying to buy a NEW scanner.

Newsgroup: rec.radio.scanner
Date: 1995-04-14 00:00:00 UTC
From: Paul Reece <preece@clare.tased.edu.au>
Message-ID: <Pine.SUN.3.90.950414170133.22236B-100000@slick>
Source record: 258433

Well all.. I recently decided to take the plunge and go in search of a new scanner for myself.

Currently I have a Bearcat 100XLT which has done a a few years of good service now, but is a little lacking in the frequency-range area.

Anyway, I opted to pop down to a local store (Dick Smith Electronics) where I bought the 100XLT from, and noticed the new 2500XLT so I took it.

Well..... Frequency range of 25-1300Mhz was good, operation was easy. 400 memories.. Auto-program etc.. BUT the reception was absolutely crap compared to my 100XLT.

Sitting both next to each other, the 100XLT could easily pick things up that the 2500 couldn't, so it was back to the shop where I swapped for an AOR AR1000 thinking, this must be better.

Was I right? Nope. The AR1000 was even worse than the 2500XLT and struggled to pick up anything at the best of times (even with my Jim GaAsFET pre-amp connected)

So... tomorrow I'm off to get a refund (the store is very good in regards to this - you don't like ANYTHING, you get a refund no-questions asked), but I will *still* be without anything new.. so.. a few questions:

What is the BEST available scanner available that has a frequency range of around 5-1300Mhz (mostly continuous), is handheld and costs less than $600 Australian $??

It could just be that I'm fussy, but I can't justify spending $600 on something that can't pick up things my $300 100XLT can.

Anyway, thanks all in advance.

- Paul Reece

Replies by email please.. news-system here isn't so good recently.

PS: are there any Scanner WWW/FTP sites around?

602. Need help with Motorolla Radius

Newsgroup: rec.radio.scanner
Date: 1995-04-14 00:00:00 UTC
From: seguine@sirius.com
Message-ID: <seguine-1404951713530001@slip120.sirius.com>
Source record: 258475
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

I have a Motorolla Radius M216, It has an acessory connector on the back, like 20-pins or so. Does anyone have the pinouts for this? I would like to hookup a voice inversion box to the unit and I need to get audio out and into the radio. I'm also interested in the pinouts for the mic connection, I understand that they interface to a computer through that port.

thanks
-chris

I took my scanner to Taiwan & survived! This is the Republic of China, not
the PROC! The two countries are VERY different, although I wouldn't mess
about too much in Taiwan!

I'm no lawyer, but it seems to me that a sharp police detective would use
the anonymous info to key a subtle investigation and hope to find
something damaging on the culprits that would stand up in court without
ever having to tell anyone about the call that aroused his suspicions.

Don't know if these would fit your needs, but I am a metal detector
dealer and I sell a headphone called the AudioPhone II. It is made
especially for metal detecting, but it should work fine with scanners.
It has cups that completely cover the ears (don't want extraneous noises
blocking out those deep coin signals!), separate volume controls for each
ear, a stereo/mono switch, and a coiled cord so it won't flop around.
They retail for $50; I sell them for $28 including shipping. Only
problem is that the plug is 1/4-inch, and most scanners want 1/8-inch.
If you want more info, buzz me email. ---Dan, N9XDK

Try the 'Spectrum Radio BBS' on (03) 455 1309. They are a BBS devoted to
radio and have a large amount of freqs. available for download.

>|> Thanks for the help!

Yup, I have one. It works pretty good. Can't really say much else about it without making measurements that I'm not equipped to make... I easily receive VHF repeaters in a 50 mile radius, for what it's worth.

All of my scanning is in the VHF and 400 MHz UHF range, so I can't comment on 800 MHz coverage. I'd bet the supplied coax is pretty lossy at 800 MHz.

These things are something like 12 ft. long, so you have to get it up above the roof a bit if you plan to mount it up there. Mine is clamped to the plumbing stack.

613. Cellular look-a-like scanner antenna

Newsgroup: rec.radio.scanner
Date: 1995-04-14 00:00:00 UTC
From: ad178@FreeNet.Carleton.CA
Message-ID: <D709Gt.EDn@freenet.carleton.ca>
Source record: 258486

I bought one of these cell look a like antennas because I preferred
a less conspicuous look. Well, it was easy to install and looked
great BUT...Talk about a scanner going deaf! My reception dropped by
about 50% (at least!). I've been told by others of the same experience
so I figured I'd post it for anyone else considering buying one of
these things....DON'T the loss in performance compared to a standard
all band mobile scanner antenna is not worth it...probably cheaper too!

-Tom

Here is a list of radio realted newsgroups. There may be some regional groups
that are not on the list, but this covers most of them. For used scanners,
your best bet is r.r.s. , a.r.s. (not to be confused with
alt.religion.scientology), and rec.radio.swap.

alt.radio.scanner - Above 30 MHz (rec.radio.scanner)
alt.radio.scanner.uk - scanning discussions for the United Kingdom
alt.cellular - (I've never seen any cellular related traffic yet)
alt.radio.pirate - Pirate radio station topics
rec.antiques.radio+phono - Antique radio & phono topics
rec.radio.amateur.antenna - Antenna related topics
rec.radio.amateur.equipment - Radio equipment discussions (mostly Ham)
rec.radio.amateur.misc - Main newsgroup for Ham radio topics
rec.radio.amateur.digital.misc - Digital communications (including Packet)
rec.radio.amateur.homebrew - Make your own radio equipment
rec.radio.amateur.packet - (not used any more?)
rec.radio.amateur.policy - Ham radio rules, regulations, policy changes
rec.radio.amateur.space - Ham radio & space communications
rec.radio.broadcasting - AM & FM broadcasting
rec.radio.scanner - Monitoring above 30 MHz
rec.radio.shortwave - Monitoring below 30 MHz
rec.radio.swap - radio related sales & swap topics
rec.radio.cb - Citizens Band Radio topics
rec.radio.info - Radio related newsgoup FAQs, reference info,
phl.scanner - Scanner topics in the Philadelphia, PA area.

> --
>
In addition to Police Call, try the new (2d?) edition of Monitor America, which is an excellent reference for freq's throughout the country. It's not as comprehensive as Police Call, but it provides some additional information you won't find there, such as media and entertainment freqs. It also has explanations that you don't find in Police Call (such as which geographical areas are covered by which city police freqs). Use the two books together and you'll be set.

If you're new to scanning, remember that the hills in Pittsburgh will prevent you from hearing everything that you want, even with a big antenna setup.

David

: >ammended to the privacy act of 1986. Now it is illegal to listen in on
: >portable phone conversations as well.

: I just want to be crystal clear on this as it was always a bit cloudy
: to me... but is it illegal to just LISTEN, or to REPEAT (reproduce,
: tell anyone about, etc...) what you heard? In other words if I'm just
: sitting alone one day with my scanner and I hear a cordless phone
: conversation - I'm breaking the law? I was always under the impression
: that the airwaves are open to the public, yet if I repeat or even worse
: TAPE the conversation and play it back to someone, play it at parties,
: rebroadcast or transmit it, make a CD and call it the "Jerky Neighbors"
: - THEN - it was illegal.

: If it's so illegal just to LISTEN, why do they even include that
: frequency range on a scanner to begin with?

: Bill

The ECPA was recently amended. The affect of the amendment is that now
it is illegal to 'intentionally listen to, use, or divulge the contents
of any telephone conversation (either cellular, cordless, or other
private means of telephone signal transmission) unless you have the
consent of a party to the conversation (unless such activity is otherwise
illegal).'

The reason the frequencies are included are that:

a) The legal change was recent (so future scanner's MIGHT have these
frequencies locked out).

b) There are other unrestricted services that use frequencies in the
same range as those used by telephone services, so a simple band-lock
(as works with cellular) would not work. There would have to be a
specific frequency lock, which would be a little more expensive to
implement.

c) Scanner manufacturers have not been told that they can't include
them (as they have been told with cellular).

The change in the law Came about by N8HKV here in Flint Filing a petition
to have it changed
Your info is incorrect.
No-code was added to the law
You must be Bonified Police Office or an amatuer Radio operator holding a
Technician or hoher class license.

This does not include the NOVICE class license.
And you don't need to own the vehicle. All you need to do is just drive
that vehicle.

Hmmm... that's odd. I called to tell them I was going to send my AR8000 back
for repairs (the antenna post of the radio was loose), and they specifically
told me to included *all* the accessories with the radio. I did include
a list of everything included with the radio in the cover letter though,
including the s/n. I thought it was kinda odd, so I asked them to repeat
it, and yes, they wanted *all* the accessories sent back also.. Pretty
weird policy, if you ask me...

It's a CB radio. Ten channel. Energ 1 = channel 9, info 1 = channel 19,
info 2 = channel 21, etc. It's not GMRS just handheld CB.

Source record: 258513

A really mono earphone is the Sony MD-91D (3.5 mm - 1/8" plug) or the Sony ME-L55D (2.5mm - 3/32" plug). I have used these with different handheld scannners for several years now and are pretty good. Have used it at some major disasters including high pressure steam leaks, at a building collapses, explosions, and major fires. It fits in one ear and looks like a walkman single ear plug.

I found these at:

MetroWest Inc.
822 N. Spring
LaGrange Park, IL 60525 (USA)

Phone: 708 354-2125

Please call them for a catalog. I have conducted business with them for several years and find their products to be very good. Their speciality is Hand-held scanners accessories (battery packs/chargers, antenna's etc).

Can someone tell me the frequencies used by EMS/Paramedics for traffic with the hospital emergency departments in the Phoenix area? I'm talking about the medical traffic (vital signs, hospital orders, etc.), not the dispatch frequencies, which I've found with no trouble. I'm in training as an EMT myself, and originally got into scanning specifically to hear what actual runs sounded like. Perhaps they're encoded, or I've just been out of range.

Please e-mail me at jondru@indirect.com.

Thanks for the help!

If they had permission to shoot, why did he ask first?

> * The front door, which we have pictures of, has 24 bullet holes in it -
> they are clearly all entry holes.

Are you sure? With certain rounds it can be mis-leading to the in-experianced
observer.

> * There are no less than 39 bullet holes in the exterior of the house -
> all entry holes.

Once again, are you sure? Certain rounds leave the concave part of their
blowing away of the material on the opposite side that you might expect.

> Beyer and J.J. overheard two of Lekan's neighbors saying they had
> received threatening phone calls to keep their mouths shut about what
> they saw.

Well, if your willing to name names, e-mail me I live in the Cleveland area,
and do freelance newswork. *If* any of this can be substaniated you are on
to a major story.

But I doubt you will, or you wouldn't have posted this anonymously. Don't
tell me: You're in danger for your life if the government finds out who you are,
right.

> * Tony Gilbert, who has previously prosecuted police for Constitutional
> violations, was quoted as saying: "There was no circumstance that
> required an immediate response. No threats were made, no hostages were
> taken, no injuries were received." and "You just can't bust in a door
> because you think somebody may be in danger. You need some probable
> cause."

Probable cause in Ohio can be: a police officers "belief," due to his
"experience," that someone is in danger. The action of his breaking down
the door in this instance, though unadvisable, was not a violation of
rights.

> Questions
>
> * Why was Lekan found with a gas mask and two oxygen tanks if he intended

> to commit murder and suicide ?

It's explainable because he knew the police would eventually use tear gas.
He probably didn't plan originally to kill himself.

> * Why wouldn't Chief Beyer comment on the issue of a search warrant ?

Well seeing he shot two cops, I guess they were wrong, huh.

648. Re: Scan Defeat

Newsgroup: rec.radio.scanner
Date: 1995-04-14 00:00:00 UTC
From: JR2 <jcr1434@hertz.njit.edu>
Message-ID: <Pine.ULT.3.91.950413175724.27535A-100000-100000-100000-100000-100000-100000-100000-100000-100000@hertz.njit.edu>
Source record: 258521

In my system, it is meant as scan defeat, and the manager of the system is quite proud of it. I should have said that the buzzing IS transmitted after each transmission, but only after a whistling tone (lasts about 2 seconds). BUT it is also transmitted regularly, steping through the channels. Even if there have been no transmissions for the past 20 minutes, it will buzz on channel 8xx.xxx for about 6 seconds, then go to the next channel and buzz for 6 seconds, etc. Also, conversations and "responses" to transmissions are on different frequencies, just one more complication.
What I find VERY bothersome is when I'm working (usually doing something that requires silence, like oscultation) and my radio just can't hear the control channel. It goes into the fail-soft system, and starts listening to all broadcasts, including the scan-defeat!
Thanks for your suggestions, though. Any additional help is greatly appreciated.

I don't know about any mods, but the reason that you're getting cell phones in the low 900 Mhz range is because they are transmitting on those freqs. Certain cellular companies stray from the 800 Mhz range and operate their phones in that 900 Mhz range... In other words, 900 Mhz band is partially a cellular band.

I've got a SPORTCAT myself, and for the money, I think it is one of the
best scanners out there. 12 bands... 10 banks of 10 channels each...
very quick scanning speed... lots and lots of features...

IMHO, its the best scanner out there for the money.

(As for cellular mods, that's illegal! [grin] But if it were legal, I
haven't found any yet...)

Here's the EXACT wording of the law (plus a few typos)... Judge for yourself... It's just a matter of how a judge interprets it...

Paragraph 397. Equipping motor vehicles with radio receiving sets capable of receiving signals on the frequencies allocated for police use.

A person, not a police officer or peace officer, acting persuant to his special duties, who equips a motor vehicle with a radio receiving set capable of receiving signals on the frequencies allocated for police use or knowingly uses a motor vehicle so equipped or who in any way knowingly interferes with the transmission of radio messages by the police without having first secured a permit to do so from the person authorized to issue such a permit by the local governing body or board of the city, town or village in which such person resides, or where such person resides outside a city or village in a county having a county police department by the board of supervisors of such county, is guilty of a misdemeanor, punishable by a fine not exceeding one thousand dollars, or imprisonment not exceeding six months, or both. Nothing in this section contained shall be construed to apply to any person who holds a valid amateur radio operator's license, issued by the federal communications commision and who operates a duly licensed portable mobile transmitter and in connections therewith a receiver or receiving set on frequencies exclusively allocated by the federal communications commission to duly licensed radio amateurs.

OK, I hope I didn't forget anything...
Now how I would interprete this...
I would say as long as you tell the officer you're using the scanner to monitor HAM radio frequencies, they shouldn't bother you... If course if you're listening to a police freqency while an officer is standing next to you, you'll probably be shit out of luck...

Of course it'll sound distorted... Music range generally is from
about 20-18000Hz, but the phone allows only a 4K bandwidth...

I don't know how they modify the music for e.g. music on hold and stuff.

BTW, it is illegal to e.g. replay music over the phone lines as music on
hold without first having a contract with the recording company allowing
you to do so.

I've found that they differ from city to city, police dept to police
dept, etc. There appears to be no set 10-code, ferinstance the
sherrifs 10-code and a local police dept's 10-code differ so much that
one means jaywalker and the same code on the other means officer down.
(maybe a minor exaggeration for effect, but close). He'd be better off
checking locally, like at the local Rat-shack.(radio shack)

> Its been proven that if left to their own desicion (sic) on speed, that
>the vast majority of motorists will procede at a speed very safe for
>conditions.

Please cite your references which `prove' this `fact'.

The vast majority of motorists know nothing of frictional coefficents
of pavement and rubber, nor about rotational mechanics.

>The speed limits imposed on our highways are set below what
>they should be

That's called a safety factor. It's needed because of the vast
differences in driving skills of motorists. The older folks
have slower reaction times, and the youngsters sometimes think
they're immortal.

>inorder (sic) to support police departments that have absoultly (sic)
>nothng (sic) better to do.

You're speaking from opinion rather than fact. If federal funds
are used to construct a highway then the feds can mandate the
speed limit. If a city/county/state wishes to go against the
feds, then the feds can (and will) withhold funds. I've seen
this happen both here in Hawaii and in California.

I was a fireman back in SoCal and rolled on many nauseating
traffic accidents whose sole cause was speed. Shall I describe
what's left of a body after it impacts a center divider at 90mph
(after it's flown through the windshield thus causing the head
to seperate from the body)?

Get out of your dream world and just do the speed limit.

Now, let's get back to scanning!

Source record: 258621

> What channel (i.e. clearance, departure ctrl., tower) is the instructions
> that tell the plane to change freq. transmitted on?

Radio usage varies depending on the class of airport, the presence of a
controlled airspace, and the type (IFR/VFR) of flight. The sequence might be:

ATIS - Automatic Terminal Information Service
CLNC DEL - Clearance Delivery
GND CON - Ground Control
TOWER
DEP CON - Departure Control -or- APP CON - Approach Control
ARTCC - Air Route Traffic Control Center ("Center")

All but the last are listed in the regional Airport/Facility Directory and
on the appropriate navigation charts.

If a plane is taking off within or under a Terminal Control Area (TCA or
"Class B" airspace), the pilot will receive the App/Dep Con frequency from
ClncDel when he checks in. If there is no ClncDel at the airport and the
pilot has neglected to note the App/Dep Con frequency, he can ask Tower
when he's airborne. If he will be using Center, Dep Con will give him the
frequency during the handoff.

If you want to follow the traffic, get a copy of the A/FD from the pilot
shop at a local general aviation airport, as well as the Enroute Low
Altitude Chart for your area ($6-8 for both). The frequencies for the
various remoted sites for the ARTCC are displayed in crenelated boxes at
their approximate locations.

There is no easy or cheap way of doing it. To do it would require very expensive equipment (in the $2-3,000 range) plus permission from the city that operates the system.. If you live in the south Florida area as your cybergate address suggests, just wait for later this year when Dade County hits the air with their 50 channel GE trunked system. It will make the smaller 20 channel systems used im Miami, Miami Beach, Broward County, Ft. Lauderdale etc. seem like kid stuff.

In article <v01520b00abb3035c10cd@[131.230.253.10]>,
Scott Manthe <scam@siu.edu> posted the first half of an interesting
Standard C568A dual band HT review. First, thanks for sharing
your findings. I note the passage:

>.... Of particular interest is a sensitivity curve for the out
>of band receive. When posted, these will be usable sensitivity
>figures, not the ridiculous squelch opens figures normally posted...

Why is squelch sensitivity a ridiculous measurement?
Both metrics have value.

By squelch sensitivity, I assume you are speaking of how strong
a signal must be to open the squelch.

Squelch sensitivity is often important, for example:

(1) Waiting for a call while the receiver is squelched.
(2) Scanning memories or searching (sweeping),
during which time the squelch is closed.

Squelch circuits with a lot of hysteresis force the operator to
to keep the squelch "tight," missing weaker signals which a
sensitive receiver would have little trouble hearing when the
squelch is open.

Note: I have included the scanner newsgroups in this followup because
the extended receive coverage of the C568A is of interest to
those readers, many of whom are hams.

Folk,

Mike is "pissed" because he read an article I posted nearly a week ago.
If you remember he posted...

In article <3m850s$2ut@pipe3.nyc.pipeline.com> you write:
>
>Pro 2006 400 channel Scanner
>
>$225.00
>
> We Pay Shipping on all radios (usa mainland only)
>
>E-MAIL all Replys
>We will Upload a photo of radio you want if requested
>--
>METROSOFT

At that price I quickly responded. Who wouldn't? The next day he
responded with email confirming that the radio is mine if I send him
CASH upfront. He also left a message only and fax number. I called
several times leaving both my home and work numbers so that I could
voice verify the deal. 3 days later I had a message on my home
answering machine from him saying he's legit and to send a check if
I was interested. Through email only (we NEVER did speak), I finally
convinced Mike the only way I was going to buy the scanner was via COD.
He agreed and was supposed to ship this coming Monday.

Now comes his follow-up to my article nearly a week after I posted my
concerns about this deal/individual to the net. I've received 6 messages
from you all telling me to "walk (some said run) away from the deal".
Only one person offered a testimonial, but was from "aol" (sorry Frank).

I've since sent email back to Mike acknowledging the fact that he wants to
terminate our "deal". I've also suggested to him that he was using a
week-old article as an excuse to back out of a COD (ala imaginary scanner?)
arrangement. Once again, if I'm wrong I apologize. In case anyone's
interested, Mike apparently still has for sale a 2006 for $225. He can

be reached at...

Michael Rosenberg <dead@nyc.pipeline.com> (note the login)

Good luck and sorry for the bandwidth,

Greg

In article <3mnotu$rqd@outer.net>, Clint Todish <ctodish@levelone.com> wrote:
>Does anyone have experience with this unit? Does it have decent sensitivity? How about mods?

This is the successor to the AR1500/e/x; it is also sold as the Camnis HSC-050 among others.

It is more sensitive than prior AOR scanners and has a much simplified (but still arcane and non-logical) user interface.

It seems to have a noisier CPU and can require high squelch settings on VHF hi to overcome this.

A very major downside to buying the Trident name is that the sole supplier is ACE Communications. Scan this newsgroup for the continuing flow of negative comments about them.

Probably youe best book with that info is ScannerMaster. This has all the freqs and callsigns for New York city and its surrounds. You can get the book at various sources in the New York area like Barrys Electronics in NYC, Gem Electronics stores, Gilfer SHortwave Radio in Park Ridge ,NJ. ScannerWorld in Albany may also have it. Info is very good and quite accurate.

680. Re: Is there a way to get JUST POLICE/FIRE ?

Newsgroup: rec.radio.scanner
Date: 1995-04-15 00:00:00 UTC
From: ad225@detroit.freenet.org
Message-ID: <3mnfeu$i3u@detroit.freenet.org>
Source record: 258441

In a previous posting Richard Green asks if there is a way
to eliminate the public works and water department traffic while
attempting to monitor police and fire on his community's 800
trunked radio system. The answer, unfortunately, is "no."

The same frequencies are shared by all on a trunked system,
though only those radios programmed to talk to one another
may. In other words, while you are listening on a scanner to
all the conversations, the trash collector's radio, for example,
is programmed so as not to hear police and fire communications.

Typically such systems are also prioritized so the radios
assigned to public safety personnel have first right to
the frequencies when all are in use. Those lower in the peckin
order get busy signals and must wait until an all clear
signal is transmitted before claiming the rights to the
channel(s).

Because of the irritating encroachment of non emergency
communications, scanner buffs interested in police and
fire traffic only on a n 800 trunked system find the
pickings best at night when the other city services
are mostly closed for the day.

Also, you have probably noticed this but I'll mention
it anyway: when monitoring 800 trunked systems you'll
sometimes find a conversation beginning on one channel
and automatically switching to another making it
difficult to follow.

Finally, there is usually a control channel on which
a tone is emitted for a 24 hour period. But the
control channel changes randomly once a day.
So if you are intent on monitoring your local
800 trunked system, you will have to lock out a
new channel, and cancel the lock out on the old,
once a day as well.

I hope this answer helps you with your scanning.
Good luck!

Hulloo

I recently acquired a Regency mx7000 scanner. Had it opened up
the other day and noticed that on the front display board there
is a spot for a battery. I imagine this would give me longer-term
memory storage than the 1 farad cap presently does.

Anyone know what battery model I should put in there, or at least
what voltage?

Any other hints or tricks for the MX7000 would be appreciated.

Thanks de Jim

: Of course it'll sound distorted... Music range generally is from
: about 20-18000Hz, but the phone allows only a 4K bandwidth...

: I don't know how they modify the music for e.g. music on hold and stuff.

Actually, the bandwidth of a typical telephone line is in the 300-3000Hz
range. Despite that, you can get music over the line although all the
"highs" over 3000Hz are lost as well as the low bass. Consider that
AM radio has been band limited to a max of 5000Hz and you can see why
music on hold does work as mentioned below...it sure isn't great
fidelity, but it shouldn't be distorted.

Although I can't be certain, I do believe there is such a program.
However, what about a regular Database program able to be bought
anywhere. They can doctored up to your specifications.
The one I have has been switched around quite a few ways, and you can
search for duplicate information in any feild or search for the
information of your choice.

If you need something, let me know E-Mail. Perhaps I can help you out.

Sounds like the squelch circuit or something in the power supply
affecting the squelch circuit has quit.

A defective squelch circuit will not allow audio out, even with the
control wide open, also, it will affect the scanning.

Not having seen the radio, I'd say that this hunch is pretty much on
target.

A defective squelch circuit can do other things as well.

>
> Mike

With a scheduled airliner, this is how it usually goes: The pilots
contact clearance delivery. This is pretty much the only frequency
that they have to look up in a publication for the airport that they
are at. Clearance Delivery will inform them of their routing and usually
the frequencies that they will be using. (Sometimes this is done by the
new ACARS system, so you might not hear much unless you can decode it.)
Then the pilots contact ground control on the frequency that they have
been given. Sometimes they have to look that one up too. Ground control
will hand them off to the apropriate tower frequency, and after take-off
they are handed off to departure and then the centers. Every time, you
will hear something like "United 452, contact tower on 125.7" or "Delta 72,
contact Chicago center on 132.5".
In case you have been asking for the specific frequency of Clearance
Delivery, they vary from airport to airport. You can find the frequency
on every aeronautical publication for your area though. If you can't get
a hold of one, just scan the airband until you hear someone rattling
down a lot of numbers and names. Ex:"Cactus 612, you are cleared to Los
Angeles via Ficticious deaperture, maintain runway heading and climb
and maintain 6000 feet. Departure frequency is 126.4 etc..." Something
like that at least... If you're quick, you can write the frequencies
down. At small airports or with small/private airplanes, things can be
a little different, but I think I have written enough already...

I've got a 2026 in the living room, and when I'm in the freq search low-to-high mode, the radio beeps LOUDLY through the headphones, even with the volume turned down, whenever I hit the up or down keys. Is there a simple way to disable this aggravating beep? ---Dan

In reference to 418.300 - USPS - it could very well be the USPS. It would be one of the following:

Postal Inspectors
Postal Vehicle Maintenance

The Postal Inspectors operate everywhere - their main office is located at the Main Post Office in downtown Seattle. Don't know if they have a transmitter or repeater there - a look on top of the building would tell.

The Vehicle Maintenance Facility (VMF) has vehicle maintenance people out performing tasks on postal vehicles. There are also other Postal Maintenance people out doing other repair tasks at Postal facilities, mailboxes, or vehicles.

If you hear any call signs, let us know.

IA>>I have just bought a RS pro 51 handheld scanner, i would like to know if
IA>>
IA>>1.) If there are any mods for this scanner
IA>>2.) And why am i picking up cell phones in the low 900 mhz range

IA>I don't know about any mods, but the reason that you're getting cell
IA>phones in the low 900 Mhz range is because they are transmitting on those
IA>freqs. Certain cellular companies stray from the 800 Mhz range and
IA>operate their phones in that 900 Mhz range... In other words, 900 Mhz
IA>band is partially a cellular band.

IA>-AdaMatt@aol.com
IA>^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
IA>:::::::::AdaMatt@aol.com:::::::::
IA>^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

that's not the reason your scanner is receiving cellular in the low
900MHz range. Cellular phone mobiles transmit 45MHz BELOW the tower
frequencies (tower = approx 896-892MHz, mobile = 806-approx 840MHz).
his scanner is a typical double conversion which makes all the IF
images of signals appear appoximately 21MHz HIGHER than the original
frequencies. he's hearing the images of the upper half of the cellular
phone tower frequencies (about 880MHz +) 21MHz above the actual
frequencies, so they would logically be starting at the low 900MHz band.

just thought i'd clarify this before someone else did...

707. This Just In: Cordless Law

Newsgroup: rec.radio.scanner
Date: 1995-04-15 00:00:00 UTC
From: dhughes@prairienet.org
Message-ID: <3mnb2h$b2v@vixen.cso.uiuc.edu>
Source record: 258468

From the Associated Press today:
TALLAHASSEE, Fla.--Police must have court approval to intercept cordless phone conversations and use them as evidence, the state Supreme Court ruled. The decision Thursday came in the case of Joyce and Edgardo Mozo, who were arrested on drug charges in 1991 after a conversation police overheard on a cordless phone.
The Mozos were charged with possession of cocaine and marijuana after detectives heard Mrs. Mozo tell an unidentified man there was just "powder. No rock" available.
Detectives were near an apartment complex using a scanner to monitor private telephone calls.
"The detectives' goal was to use the scanning device to scan frequencies at random hoping to come across some kind of illegal activity," Justice Charles Wells wrote for the majority, which found the action violated the Security of Communications Act.
During their trial, the Mozos asked that evidence be suppressed because the search resulted from the interception. The couple pleaded no contest, but appealed their case. An appeals court ruled in their favor, and the high court also backed the Mozos.
Thursday's ruling sends the case back to the trial court, but prosecutors would be unlikely to go for a 2d trial with no evidence, according to James McLane, head of the state attorney's appeal division in Fort Lauderdale.
However, McLane, calling the case "far from over," said there was a good chance that the state would ask Florida's high court to reconsider its decision and, if unsuccessful, appeal to the US Supreme Court.

Hello.
I have these two scanners for sale:
1. Realistic PRO-57
2. Uniden Bearcat Sportcat 150B

1. Realistic PRO-57
base/mobile, backlit full frequency LCD display, direct frequency
entry keypad, antenna, 30-512mHz, nice condition-$75 firm

2. Uniden Bearcat Sportcat 150B
100 channels, 800mHz, backlit full frequency LCD display, direct
frepuency entry keypad, rubber duckie antenna, ni-cads, charger,
handheld, covers 29-956 cell blocked.
Two months old, paid $200, sell for best offer.

Leave mail if interested.
Thanks.

From: lou@gary.com
Message-ID: <782348173101@gary.com>
Source record: 258472

Seems pretty strange that he isn't picking up any signals of interest. There's hardly a day goes by that I don't hear something here, and I'm not even in the big city. I live 35 miles away from Pittsburgh, and the area is comprised of a lot of small towns. But, there's still plenty of action.

Better either recheck the programming or your antenna or something. It may not provide you with "James Bond" type stuff, but it sure is interesting.

Of course, there are those, who just don't get a thrill out of such things. If that is the problem, then perhaps you should try to recoup as much of your investment in the scanner as possible. In other words, find a new past time.

As you know by now, the Pro26 is a version of the BC3000XLT. For people that can't live without the extra 200 channels, they can get the 3000XLT. But, for people that appreciate the mating of Uniden and RS features, the Pro26 is really wonderful. $399 is too much to charge for 200 channels, but at $50 to $80 off during a sale, it'll be a good deal.

The Pro60 from GRE will probably come out for $349 in the summer.

Yes, there could be some sort of malfunction at the radio but, if none is found, the interference is a cross the scanner listener must bear. The engineer might have some suggestions, but the station is under no obligation to do anything if it is operating legally. If it's directional, it must be within its assigned parameters and its power must be no more than 10% below or 5% above its licensed power. A bad guy wire connection will affect an AM station, but not an FM, but my guess is the interfering station is more likely to be an AM.

BTW, an AM station is more likely to have trouble with its ground radials than with its guy wires. Guy wires and turnbuckles are exposed to the elements, but ground radials are exposed to critters! :-)

The reason most PD's will allow a few mph over the limit is not because their radar isn't accurate...it's more accurate than your speedometer...but because your speedometer isn't accurate, you might be one or two over the limit without knowing it.

Various factors affect your speedometer's accuracy, including tire size (change to a different tire size and your reading can be way off), tire inflation, etc. A malfunctioning speedometer is not a legal excuse, but most PD's won't write you until you're enough over the limit to be blatantly speeding, even if your speedometer is off a little.

If an officer decides to give you 10 over the limit, he's pretty sure the judge will agree that you must have been speeding with intent to do so (although intent is not necessary for guilt in traffic violations).

Another factor that affects how much leeway a PD will give is the judge who tries their cases. If a judge is know to be tough on speeders, they can write at 1 mph over the limit. If the judge is fairly lenient, they may not bother writing until you're ridiculously over the limit. I worked with a department that, as a rule of thumb, allowed 14 over the limit before writing a ticket.

(SNIP, ouch hey watch it wit that thing!)

Out here in CA, there are a number of 65mph freeways. In the central valley, I remember one CHP officer commenting that they won't even think about you till you push 80mph. I got pulled over for 92mph and got out of it. "Gee officer, the road is just so dull, I really wasn't aware how fast I was going" What they really are looking for on highway 99 is reckless speed and blowing through the small towns, the speed limit goes back down to 55 when the freeway hits a town.

In 20 some-odd trips between Fresno and L.A. over two years I have seen only about 5 CHP cars ever between Fresno and Bakersfield. IOne of which had this pretty red light when I saw it in my mirror.

For those who may be out in the central valley, CA area, or may be traveling through, the CHP uses aircraft for speed enforcement. (That's what got me at 92) Usually they are looking for speding big rigs, but will nab ya if you're creating sonic booms. What to listen for on the scanner on CHP staewide blue more than likely, is for either Air 45 or Air 43, which are the two planes based out Fresno. There are white stripes painted on the freeway that the a/c uses to judge your speed.

Oh yeah, CHP doesn't use radar on freeways so forget the detector.

First off, the Pro 26 does not necessarily replace the Pro-43. Nor does
it replace the Pro-60. The Pro-60 is still expected to roll out this
summer!!!

Nope...I seriously doubt that you will see a mod for the Pro-26. The
26 is still TOO NEW for the hackers to get into it. Additionally,
I'm sure that if the mod is as easy as it was in the Pro-51 (keyboard)
or a diode move, and the info was posted here, I wouldn't be at all
be surprised to see FCC instruct RS to pull them off the shelves.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, armored cars, trains, taxis,
airplanes, and buses are all equipped with radios and you
can listen to them. You can monitor the local sheriff and
fire departments to hear about events "as they happen,"
before the news reporters hear about them. Hostage dramas,
bank robberies, car crashes, chemical spills, tornado
sightings are all fair game. In a single afternoon, you
can hear a high speed police chase, Drug Enforcement agents
on a sting operation, and undercover FBI agents as they
stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000

have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g.,

hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 is a good performer. All three models employ up conversion and are made for Radio Shack by GRE (General Research Electronics). *

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a spring shaped antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to lightning strikes because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they |
are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606. *

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner

modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed

for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret | Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by | James Tunnell and Robert Kelty, lists federal agencies and | frequencies and deserves a read. However, many pages are | devoted to appendixes and references which contain no | frequency listings. The space would be much better used by | a combined federal frequency list sorted by frequency. |

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It may disappoint experienced | scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the | NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and

contains a handful of fields for every FCC license in the US. It works well.

Grove enterprises sells FCC license information on CDROM for $100. The fields are similar to PerCon's Spectrum CDROM, but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" | scaled color map marked with transmitter sites, cities, and | highways. I call this innovation RadioMap(TM) service.

RadioMap has been very favorably reviewed in RCMA Scanner | Journal, American Scannergram, and USSN. |

It allows you to identify antenna sites and visualize the | transmitter locations in your neighborhood, near your | office, at an airport, and other places of interest -- from | VLF through microwave. RadioMap includes police, fire, | local government, TV, business, industry, common carrier, | railroad, trucking, and many more types of transmitter | sites. In addition, wireline and nonwireline cellular | phone and AM/FM broadcast transmitter sites are clearly | marked using unique color icons. Industry uses RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites.

The RadioMap processes and software are unique and | proprietary. RadioMap is completely different from, and | independent of the Grove Enterprises CDROM and the current | version does not use a commercial mapping program.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq.

mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states. Send $25.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine

the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, most at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All
meetings will be held on Saturdays at locations announced
in advance.

February 18, 1995 - Westmont Police Dept.
April 15
June 17
August 19
October 14
December 16

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from
Police Call, which gives a more sterile, but uniform

treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information. |

Tab Books Master Frequency File, first edition, written by | James Tunnell and Robert Kelty, lists federal agencies and | frequencies and deserves a read. However, many pages are | devoted to appendixes and references which contain no | frequency listings. The space would be much better used by | a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. The fields are similar to PerCon's Spectrum CDROM (see below), but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies across the country, I will locate FCC licensed

and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" | scaled color map marked with transmitter sites, cities, and | highways. I call this innovation RadioMap(TM) service.

RadioMap has been very favorably reviewed in RCMA Scanner | Journal, American Scannergram, and USSN. |

It allows you to identify antenna sites and visualize the | transmitter locations in your neighborhood, near your | office, at an airport, and other places of interest -- from | VLF through microwave. RadioMap includes police, fire, | local government, TV, business, industry, common carrier, | railroad, trucking, and many more types of transmitter | sites. In addition, wireline and nonwireline cellular | phone and AM/FM broadcast transmitter sites are clearly | marked using unique color icons. Industry uses RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites.

The RadioMap processes and software are unique and | proprietary. RadioMap is completely different from, and | independent of the Grove Enterprises CDROM and the current | version does not use a commercial mapping program.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states. Send $25.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of

Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder

"armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all

transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by

others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

erik,
I see your message asking why one would lliten to phone both celluar
and or cordless. I can not answerthatone but the item that did get my
attenetion was your saying that one could not do anything with out a
warrant. I do not trust the powers to be as much as you do.
wwe had an incident here in Cleveland suburb where an officer in civies
came to the fornt door of a excentric individual because of second hand
information that he had guns out in the house. the officer tried to
identify himself as a officer but in street clothes with no search
warrant. he had a tee shirt on that displayed a rather large biker type
tatoo. the man refused to open the door and the police officer with
checking with superiors attempted to kick in the front door. he was shot
by the man but only wounded. the man after a 45 hour seige shot his son
and himself. so much for the idea that a warrant is needed. He deemed
the situation was serious enough although no threats were made against
anyone by the man. can not put all details herein but somuch for the
warrant.

Yes, George, like my PRO 43 which I carry with me at all times and my
2004 and 2006 without which I can't live.

In answer to the original post. Radio Shack is phasing out the
Realistic name on scanners and replacing it with their company name. I
remember in 1969 or thereabouts when Radio Shack first showed up in my
town. I was amused by the name Realistic. I thought it was corny.
Apparently someone at Radio Shack has finally become "Realistic".

Uniden BC3000XLT Hand-Held Scanner, new condition, 2 months old,
complete with AC charger/adapter, user manual, in original carton.

Features:

- 400 channels/20 banks
- Twin Turbo Scan & Search (100/300 ch/sec)
- 10 programmable priority channels
- Auto Store, Auto Sorting
- Freq. Transfer
- Weather Search
- Data Skip
- Selectable Mode (AM, WFM, NFM)
- Per channel Delay
- Selectable Attenuator
- Battery saver circuitry

- covers: 25-550 MHz continuous, 760-806 MHz,
806-100 MHz (with cellular image at 1005-1030)

Price: reduced to $325 (final offer)

Message-ID: <3mr73c$dn0@usenetw1.news.prodigy.com>
Source record: 258296

Yes, it's the same diode.

You can also increase speed by replacing the clock cystal with a faster one. Disadvantage is that the scan delay gets messed up, but there is a mod that fixes that, too.

Bill Cheek's scanner mod books are really helpful on mods to the 2004. Also, there's probably a WWW site that has mods; don't know the address though. The compuserve hamnet forum has mods in the library, if you have access.

I've had a 2004 since the early days and have done all the mods. Still works great. Only real disadvantage is that you can't install the new computer driven PC boards (from Optoelectronics) that go in the 2005 and 2006. But, unlike the newer units, this unit has no gaps in coverage.

Best of luck.

Its not THAT bad! In fact, over 80% of all digital pager traffic
is POCSAG coding. We sell a datascope software package which decodes
all 512, 1200, and 2400 bps pocsag traffic. We also include a bit
display where you can see the framing bits, etc.

For diagnostic purposes only.

Hi,

Does anybody have or know of a source for old or surplus
Motorola 800MHz radios? I have recently found out that the city
(Albany NY) sometimes has old radios that have been upgraded or
replaced that it sells off. I know of one person that has and
several that want these radios so that they can have the town
program them for our fire and ems talk groups.

Any information would be much appreciated.

Thanks,

Bryan

740. DIPLE LENGTH CALCULATIONS

Newsgroup: rec.radio.scanner
Date: 1995-04-16 00:00:00 UTC
From: djarrell@pixi.com
Message-ID: <3mroc0$dpk@rigel.pixi.com>
Source record: 258303

The previous gentleman accidently transposed the formula elements.
The correct formula is:

468/Freq
where Freq is the frequency in Megahertz. An example for two meters (146MHz)
would be:

468/146 = 3.205

3.205 is the end-to-end length of the dipole expressed in feet (or 38.465 inches).
At this frequency, the length could be rounded to the nearest 1/8th inch without any
detrimental effects. As the frequency rises, the length tolerance becomes more
restrictive.
More detailed information on this subject is available inn the Radio Amateur's Handbook
available from the American Radio Relay League
225 Main Street
Newington, CT 06111

The Yacht Boy 500 is a shortwave radio. It cannot be used to scan public service frequencies. If that's what you thought when you bought it, then you have the wrong type of radio.

I've been trying to find the best handheld scanner. I've narrowed it down to the AR8000. Any objections?

Okay... I know that the AR8000 has the cellular blocked, but the UK version does not. So, where can I buy the UK version of this scanner? How much is it? Does it cost more or less than the US version?

If I can't find/get the UK scanner, is the US version modifiable to recieve cellular?

Thank you much! :)

This happens because the scanner deafults to a 5 khz offset for VHF. The frequencies that you're trying to enter are on a 12.5 khz offset, which causes the scanner to move to the closest freq on the 5 khz offset. Unfortunatly, you can't hear anything if the scanner does this. I don't know about the 220, but I have the 8500 and it allows you (through a round-about way) to change the offset so 12.5 khz frequencies can be entered in any band. The 8500 allows the offset only to be changed when searching a frequency range. Once its changed there, it takes affect only on frequencies you enter after that point.

Hope this helps!

-Chris.

I think that most (if not all) laptop battery packs are nicad, as they are the only cost effective types that can be made small. There is a new lithium based type coming out, but I don't think they're in use yet.

Anyway, last time I used a Thinkpad 720C (very nice computer, pity about the price) I saw that there was a function on the 'power control' applet supplied with it that discharges the battery, prior to recharging it. So, this must be the right thing to do.

> American Fork, UT DoD#1461

So far we've learned:
1) don't leave nicads on trickle charge when charged.
2) don't leave fully charged.
3) always discharging completely may shorten battery life.
4) don't partially discharge to the same point repeatedly.

Q: Is there a problem if the battery is recharged partially (ie not to full charge)? once? repeatedly?
How do you figure the recharge time if partially discharged. (700mah on 60ma trickle charger = 12 hours no matter what discharge?)

If you don't want your '7100 hacked up, there's an external IF module that you can purchase called the Swagursat. It plugs into the IF output on the back of the '7100 and provides a 30 - 40 kHz bandwidth for APT reception. I have one, and it works okay (not great, but certainly better than without it). The only problem is that for what you get, it's pretty expensive. All it is comprised of is a metal chassis box and essentially a receiver strip from the 10.7 MHz IF back to the speaker.

Or if you're looking for an experiment with one of those IF's-on-a-chip IC's, this would be a good one.

I already have a box that does this, at least for some stuff I'm interested in....my Motorola Advisor pager.

Does anyone have access to the software/hardware specs that programs the pagers? Obviously, the pager manufacturers & companies have it, but I wonder if there is some public domain info that would be useable.

Seems like there oughta be some kind of "universal capcode" that would convert the standard pager into a general receiver. Maybe even have the ability to change capcodes on the fly.

If it's receive frequency could also be changed, then voila, a paging scanner... or a scaning pager.

Ken

You're gonna need some headphones with noise reducing capabilities, otherwise
you won't be able to hear the scanner due to the engine noise. Next race you
go to look trailers for Race Scan Communications, Racing Electronics, or Racing
Radios. Expect to pay $75/up for a decent set...

Scanners use a superheterodyne scheme, in which a very low power transmitter in the scanner called a local oscillator (LO) "rebroadcasts" the many freqencies received by the scanner front end on one frequency to succeeding stages. That means that succeeding amplification, filtering, etc. stages need not tune to many frequencies but to just one - the LO frequency.

Unfortunately, the LO injects harmonics (multiples of its frequency) into the signal path, which means that you'll receive spurious signals consisting of the real frequency plus or minus (usually plus) the harmonic frequency from the LO. In most scanners, the LO frequency is 10.7, and the harmonic added or subtracted to real frequencies is 2x the LO frequency, or 21.4. That means that, for example, you may pick up a station broadcasting at 845 MHz on 845 + 21.4 = 866.4 MHz. (That's why scanners not designed to pick up cellular phone freqencies can nonetheless pick them up on "public" 800 MHz freqs.)

The above applies to double conversion scanners. A triple conversion scanner simply adds another stage that filters out LO harmonics and thus prevents the reception of images.

Happy scanning,

Ken

I love to monitor the telephone airwaves. It is the best to do it if one lives in a n apartment
complex. The chances of someone with a cordless phone are greatly increased whereas someone who lives in a house in a nice size neighborhood.

I do not know why I monitor telephone conversations--I like to eavesdrop. Sometimes the police channels are boring--on a Sunday morning and the fire and rescue is slow too. Only thing left are telephone conversations. I have not tried it yet, but I plan to head down
to WASH DC one night and sit in my car with my scanner and monitor as many cellular converstns
as I possibly can--I bet I would hear conversations ranging from prostitute gambling to chit-chat!

>Then the pilots contact ground control on the frequency that they have
[snip]

Thanks for this info. One question:
How do the Airlines own frequencies come into play here. For example
frequency guides will show United Airlines on 131.xxx and then there is the
460MHz freqs. The 460 freqs seem to be mostly baggage and maintenance ops,
but the 131.xxx (or whatever freq) seems to have some good stuff on it. I was
on a flight leaving Hong Kong and the plane was WAY over weight, but the pilot
told the passengers something else to explain the delay. When are these
company frequencies used? Only on the ground??

If you are interested in scanning this area, Popular Communications just had an article about this. Not much new info that hasn't been in a dozen other places, except for a list of freqs that are apparently used by the base. In a way, I would be amazed if these are all 'legitimate' freqs. With the amount of deception and concealment that goes on there, for these freqs to all be broadcasting 'in the clear' kind of boggles the imagination.

>-Zeet

The term regulator is usually in reference to voltage. When charging Nicads, you just have to make sure that the current is limited. The battery packs for the 3000, 2500, etc. have a little circuit built in to make sure the current does not go above a certain limit (60-80 mA). Voltage is less important when charging nicads. A cig. lighter adapter will do fine on these packs. No additional regulators or limiters are necessary.

I think anyone who has studied this area for a while understands
that anything you hear "clear" at Groom falls into one of several
categories:

1) "Janet" flights that carry contractors in and out of the base.

2) comms from the hired rental security gooks

3) transmissions from the seismic motion detectors along roads

4) deliberate disinformation

5) stuff that they don't *care* if you hear

6) miscellaneous

From having done some, er, "studying" of this area for a number
of years and having talked to some, er, people it seems pretty clear that
anything that they don't want heard gets encrypted in some fashion.

And of course, there is that old security fall back that gets
used in many ways and in many places: RADIO SILENCE.

>not tune to many frequencies but to just one - the LO frequency.
The succeeding stages are tuned to the intermediate frequency (IF), not the
LO frequency. By the way, I wouldn't call the local oscillator a "transmitter."

>Unfortunately, the LO injects harmonics (multiples of its frequency) into the
>signal path, which means that you'll receive spurious signals consisting of
>the real frequency plus or minus (usually plus) the harmonic frequency from
>the LO. In most scanners, the LO frequency is 10.7, and the harmonic added or
>subtracted to real frequencies is 2x the LO frequency, or 21.4. That means
that, for example, you may pick up a station broadcasting at 845 MHz on 845 +
>21.4 = 866.4 MHz. (That's why scanners not designed to pick up cellular phone
>freqencies can nonetheless pick them up on "public" 800 MHz freqs.)
The LO does not "inject harmonics," but rather creates an "image frequency."
A mixer mixes the incoming signal with the local oscillator
to create additional frequencies which are the sum and the difference of the
input frequency and the local oscillator. One of the new frequencies is the
desired intermediate frequency (often 10.7 MHz); the other is filtered out.
Because the mixer creates "sum and difference" frequencies, there is

another
frequency, called the image frequency, that can be converted down to 10.7
MHz.
This frequency is 10.7 MHz from the other side of the local oscillator
frequency;
thus, it is 21.4 MHz from the desired listening frequency. A good filter
on
the front end of a receiver can reduce or eliminate this. Scanners,
however,
today are typically required to cover large ranges of frequencies which
makes good front end filters difficult to design and expensive to
implement.
This is the area that separates the good scanners from the cheap scanners.

>The above applies to double conversion scanners. A triple conversion
scanner
>simply adds another stage that filters out LO harmonics and thus prevents
the
>reception of images.
A triple conversion receiver actually has more images than a double
conversion
receiver. However, a well designed receiver should filter these images
out.

Many receivers are double conversion receivers. They use two local
oscillators.
The first typically is used to mix the incoming signal down to 10.7 MHz.
The
second typically is used to mix that signal down to 455 kHz. Triple
conversion
receivers add another stage of down conversion (usually before the first
stage in this example). This down conversion technique is extremely
common
and provides many advantages with few disadvantages. A triple conversion
receiver is not inherently better than a double conversion receiver but
often
is. Triple conversion implies a slightly more sophisticated design and,
hopefully, better, but it does not guarantee it.

AT this point there is no legislation requiring the lockout of cordless
phone frequencies (to the best of my knowledge), but then again it took a
few years until the FCC made locking out cellular frequencies (even after
it was made illegal to listen to cellular conversations) mandatory for
scanner manufacturers...

On the contrary, in the book F-117 in action, a former stealth pilot
expeined that they actually did things so everyone could hear them on
purpose. Except that they used call signs that other people were
using, like the A-7 guys at Nellis. Also they lit up nice and big on
everybody's radar, but as an A-7. They carried the same transponder as
the A-7 so it looked like it was an A-7, not a F-117. The best place
to hide something is in plain view.

BTW The call sign for Groom Lake, (Or maybe it was Tonapah) is Dreamland.
F-117s are Coyote, at least they were in Desert Storm.

802. A method to scan the Chicago Police Department

Newsgroup: rec.radio.scanner
Date: 1995-04-17 00:00:00 UTC
From: d350@aol.com
Message-ID: <3mukjt$jc7@newsbf02.news.aol.com>
Source record: 258365

ONE TECHNIQUE TO PROGRAM/MONITOR CHICAGO PD ON YOUR
SCANNER

The City of Chicago is divided into 25 police districts. Primary dispatch frequencies are shared by two, usually adjacent, Police Districts. The exception to this is Police District 3 which has a dispatch frequency all to itself. Each primary dispatch frequency is called a Radio "Zone" and are numbered 1 through 13. The first two numbers of a given unit designator tells which district the unit is in. For example, "Unit 2514" would be a unit of District 25.
There are also frequencies which virtually all mobile units have the capability to monitor. These are called "Citywide" channels and, hearing a transmission beginning with "Units on Citywide.....", makes the Police listener's aware that the immediately forthcoming radio traffic is important and intended for all units to hear.
One scanning/programming method which some scannists may find simplify matters a bit and avoid the scanner from stopping on an active frequency which contains "uninteresting" radio traffic ("down time" should there happen to be interesting radio traffic on another frequency at the same time.) is as follows:
If your scanner contains at least 20 channels, program channels 1 through 13 with the corresponding Radio Zone numbers. Channel 1 would be programmed with the frequency of Zone 1, Channel 2 with Zone 2, etc. Channels 14 through 20 would be programmed with the Citywide frequencies. Then lockout channels 1 through 13. If your scanner contains more than 20 channels within its first bank you might wish to lockout channels numbered above 20 that are within the same bank. Having done so, when scanning this bank, you are only checking and stopping on active citywide frequencies. Should you hear something like "Units on Citywide, report of shots fired, man down, at (whatever address or intersection), this is the 5th District, ZONE 9 RADIO." If you wish to hear the radio traffic of the responding units you would only have to manually go directly to channel 9 and just listen there until you've heard what you want to know.
One could, of course, modify this to suit your personal preferences. You may wish to program additional frequencies in channel numbers above channel 20 within the same bank, if applicable. If you want to keep track of all activity, all the time, within a particular District, you might want to "unlock" the channel containing the Zone number for the District of interest. If your scanner has a selectable priority function, you could still leave the channel "locked out" and just make the channel number of importance a "priority" channel and then engage the priority function.

Chicago Police Department/Primary Frequencies (Repeater Output)

1. 460.475 Zone 1 (Districts 16 and 17)
2. 460.050 Zone 2 (Districts 19 and 23)
3. 460.225 Zone 3 (Districts 13 and 14)
4. 460.150 Zone 4 (Districts 1 and 18)
5. 460.500 Zone 5 (Districts 2 and 21)
6. 460.400 Zone 6 (Districts 7 and 8)
7. 460.075 Zone 7 (District 3 alone)
8. 460.200 Zone 8 (Districts 4 and 6)
9. 460.025 Zone 9 (Districts 5 and 22)
10. 460.100 Zone 10 (Districts 10 and 11)
11. 460.375 Zone 11 (Districts 20 and 24)
12. 460.425 Zone 12 (Districts 15 and 25)
13. 460.450 Zone 13 (Districts 9 and 12)
14. 460.125 Citywide 1 (Traffic/Gangs)
15. 460.175 Citywide 2 (Detectives/Tactical)
16. 460.275 Citywide 3 (Emergency Messages)
17. 460.325 Citywide 4 (Youth/Evidence Technicians)
18. 460.350 Citywide 5 (Special Events)
19. 460.250 Citywide 6 (Unspecified Citywide)
20. 460.300 Citywide 7 (Command/Phone Patch)

The Chicago Police Department reportedly utilizes additional frequencies which may include:
154.650, 154.740, 154.800, 154.830, 155.850, 155.970, 156.000, 158.730, 158.850, 158.880, 159.030,
856.9375, 857.9375, 858.9375, 859.9375, 860.9375.(the last five frequencies may be "trunked".)
Should you have an unused channel in your scanner, don't overlook the frequency 155.475 which in
Illinois is called I.S.P.E.R.N. (IL State Police Emergency Radio Network). Virtually all law
enforcement vehicles in the U.S. are equipped to operate on this frequency. On this frequency
one will hear car chases, crimes having recently occurred, suspect and/or vehicle info, etc.
While the primary frequencies of PD Chicago may be fairly well known to long time or avid scannists of the Chicagoland area, perhaps there may be some who will find this programming/scanning style of use.
If anyone has any corrections, additions, suggestions or would be interested in exchanging frequencies, comparing notes or discussing any scanning related topics, please feel free to contact me at my E-mail address which is d350@aol.com

I hope this will be of some use or benefit to those who enjoy monitoring PD Chicago.

>for them. Sorry,

I don't really understand all the detailed confusion around plugging
any form of tape playback into the phone. About oh... 10, 13 years ago
(when I was in high school) I simply wired a jack to the mouthpiece
wires in the phone. Installed a switch, plugged in a portable tape
recorder via the earphone jack and whammo - I could playback anything
I wanted, WITHOUT ANY distortion (just adjust the volume level). I played
around with sound effects, music, and the all-time favorite - an MXR
Reverb/Echo unit and a microphone! Anything that had an output. The most
productive use was when I was about 15 and just met this girl I was nuts
over and we would talk into the wee hours of the morning on the phone.
I had a phone next to my bed, and a tape recorder. I had a mother who
liked to pick up the phone to see if I was still on it. I had a tape of
a dial tone. When ole' mom picked up the phone I hit the tape. She hangs
up the phone and we resume our conversation. Worked like a charm every time!

And it cost me about $1 in parts, and about 5 minutes in labor.

That means that succeeding amplification, filtering, etc. stages need >not tune to many frequencies but to just one - the LO frequency.

The L.O. is not intended to "transmit" or "broadcast" - it's supposed to stay in the receiver. The concept is correct but the terminology isn't. L.O.s are just that - oscillators.

>Unfortunately, the LO injects harmonics (multiples of its frequency) into the >signal path, which means that you'll receive spurious signals consisting of >the real frequency plus or minus (usually plus) the harmonic frequency from >the LO. In most scanners, the LO frequency is 10.7, and the harmonic added or >subtracted to real frequencies is 2x the LO frequency, or 21.4. That means >that, for example, you may pick up a station broadcasting at 845 MHz on 845 + >21.4 = 866.4 MHz. (That's why scanners not designed to pick up cellular phone >freqencies can nonetheless pick them up on "public" 800 MHz freqs.)

It has nothing to do with harmonics. The very design of the IF stages would prevent it passing any "harmonics" from the LO.

What does create an "image" is that the undesired signal (that is 2X the IF away from the desired signal) mixes in the first mixer and any modulation then appears in the next "intermediate" signal.

In the case of a triple conversion radio, you are correct, it adds another IF stage. If I remember correctly, triple con scanners use a first IF of about 700 MHz. That means any images would be in the 1400 MHz area. 1.4 GHz can be stopped at the front end of before it gets to the first mixer/amp. Therefore triple conversion receivers are less suseptable to images and SOME forms of intermod.

IT>165.1625 - 165.165

no. unfortunately you have one of the many scanners that doesn't take kindly to 12.5kHz steps in the vhf band. don't feel left out, few scanners will deal with these frequencies well. the best thing you can do is just do what you have been, which is just listen to the frequencies as your scanner lets you enter them. you might also want to try listening to the frequencies 5kHz down from what your scanner rounds them off to. eg. 163.465 --> 163.460. sometimes the transmitters (or your scanner!) may be de-tuned just enough to allow clearer reception of the services you are trying to monitor.

good luck

*@SUBJECT:Listing of who makes what for whom N
Hi ya, all.

I was just wondering, from reading a couple posts dealing with
Radio Shack and Realistic products, if anyone out there has a complete
listing of shortwave receivers and scanners that Radio Shack carries and
who manufactures these products for Radio Shack. A couple examples I
have collected from reading some of the messages around here are;

A DX-390 shortwave receiver with the Radio Shack name on it is
actually a Sangean ATS-812.

A PRO-51 scanner with the Radio Shack name on it is actually
made by Uniden.

Anyone have a complete list of all of Radio Shack's scanners and
who manufactures them for Radio Shack? Preferably from the most current
catalogue issue(s). Thanks in advance of what I think is a most
interesting topic of discussion.

Cheers,

General Mobile Radio Service... You need a license but you don't have to take a test. Just pay $35 and the FCC will issue u a licence. Handhelds are only limited to 1 watt, I think. Mobiles can go higher. It's aimed at the family - during camping trips or shopping or whatever.

From what I've seen, oops heard, here's how it goes.

Clearance Delivery: This is used to give the crew details of the flight BEFORE THEY PUSH BACK FROM THE GATE. It will detail flight rights, changes to the flight plan filed earlier, info about what they're carrying (live animals, hazardous goods, etc.) and clearance to the airport they are going to. The crew will be instructed as to what frequency to change to for ground control from here.

Ground Control will direct through various taxiways toward the runway they will take off from. This controller will instruct the crew as to which frequency they will select for tower.

Tower will give them takeoff permission. Tower will give them their next frequency, which will be departure control.

Departure control will get them up to or close to their cruising altitude and direct them to the proper "airway" or route toward their destination. Departure will assign them their next frequency which will be an enroute terminal service. "Toronto Center" or "Cleveland Center". This continues toward the destination.

So you see each controller will tell them what frequency is used next, but this will all be known ahead of time by the crew when the flight plan is drawn up. There are guides all pilots use which outline not only frequencies but every possible detail about every airport there is. (radio beacons, runway lighting, fuel available, customs services, you name it, it's there.)

I hope I answered your question (whatever it was ;-)

Tim.

Try again, Ambrois.

GMRS is basically FM CB, up around 463 MHz. That's where the
simularity ends. You have to be licensed to use it, but one license
covers the entire family. But the unit is *NOT* a standard CB radio.

 SLMR 2.1a He's a few Beta's short of a full release...

another difference (sorry if someone mentioned this previously) is that
the Pro-43 is triple conversion vs the Pro-39's double conversion.
The 39 is more likely to be cellular modifiable though...if you care.

GB> that GMRS may become like CB, unregulated and out-of-control.

one of the reasons to stay far away from radio shack's worthless 10 channel rig they offer. it's a piece of garbage, made by, yes, maxon. in most areas now there are several repeaters taking up the gmrs repeater frequency pairs and these units sold by ratshack are on the repeater outputs, making it very easy for them to get blasted over by a stronger repeater signal. this makes the units almost useless in close range scenarios even! not even tone squelch to keep out the co-channel users.

anyone who would purchase these piles of junk seriously needs to have their heads examined.

IE>Some departments use mobile computers so they receive their calls and do
IE>licens

IE>checks themselves.

IE>... This tagline is SHAREWARE! To register, send me $10
IE>___ Blue Wave/QWK v2.12

1. CHP does NOT use MDT's anywhere. the coverage area would have to be
too wide and there would be no major advantages to them having them.
2. CHP is in the LOW BAND VHF range. if you're using the flexible
antenna that came with your scanner, you can forget about listening to
them. you need a similar antenna to the low-band whip (about 2-3 feet
shorter than a 102" cb whip) they have on the side of their cruisers.
no glass mount antennas, no cellular look-alikes, but an honest-to-god
real lowband antenna or similar antenna with a lengthy radiating element
since other antennas just won't have the sensitivity to pull in a signal
of that wavelength. even then you're gonna have a tough time pulling in
the mobile units, and with a few rare exceptional cases, you won't hear
them any better than 10-15 miles distant. sometimes the distant ones
even come in clearer than the local ones...

>>subjective...

No - not subjective at all. The RCMA is the finest and longest-appearing
scanner group in the country, and they just happen to publish a
monthly magazine for you, too!

The RCMA (Radio Communications Monitoring Ass'n) is the
world's largest scanner club.

Founded in 1975, the RCMA prides itself on being the "first
national and international organization of monitor radio
listeners." There are several regional chapters which hold
regular meetings, and a monthly newsletter of about 95
pages. Although the focus is on VHF and UHF ranges, there is
coverage of HF utility stations below 30 MHz.

You can obtain more information about RCMA membership from:

RCMA General Manager

Subject: New GMRS 10 Channel At Radio Shack

>>I was in Radio Shack and saw that their 2 channel GMRS radio is now on
>>clearance for around $150 which is an excellent price for such a small
>>radio.

It is a useless HT - unless you can see who you want to speak with
across your front lawn.

RS has -NO- GMRS radio that will hit repeaters with CTCSS tones.
Not even their 2 new entries in the past few months.

Now then, Maxon - who builds many of RS' entries - happens to have the
hottest GMRS HT available - at ANY price (including the ICOM Commercial
U-16 at 560.00).

The Maxon 210+3 GMRS HT is a winner for -serious- GMRS communications.

The Maxon GMRS 210+3 provides 2 Watts with its supplied rechargeable
nicad pack, and 5 Watts when operated with the included 12VDC auto cord.

10 channels (7 interstitials, 462.675, and two programmable channels).

An eight button keypad is used to select channels, program radio features,
and initiate scanning modes. Channel, frequency, and radio status info are
displayed on the unit's illuminated LCD display.

User-programmable options include CTCSS, scan delay time, power save,
channel lockout, and transmit time-out timer.

The "High/Low" power switch & control knobs are conveniently top-mounted.

Included with the unit is a rechargeable nicad pack, rubber duck antenna,
AC/DC charger, vehicle power cord, belt clip, and hand strap. Available
accesories include an external mag mount antenna, base omni-directional
antenna, 3-Watt alkaline battery pack, speaker/mike, mini VOX headset, and
a nylon case. NOTE: This unit WILL use Icom accessories - and Radio Shack
HTX-202/404 accessories!

The unit retails for 299.00. There's a BBS out in SoCalifornia that is
selling them for $239.00 (909-681-6221). They even take checks online,
if you're hesitant about leaving credit card info online. It's a Ham
Radio BBS, and the owner is involved in GMRS/Ham/REACT in SoCalifornia.

>>This radio will have a hard time selling considering Maxon has a new
>>10 channel radio in which all GMRS freqs can be programmed into it by
>>the user.

This is not entirely correct. Channels 1-7 are the GMRS interstitials -
hard coded in the HT. Channel 8 is 462.675 - and is user-settable for
CTCSS and Simplex/Repeater operation. Channels 9 and 10 are dealer/
user programmable for either 462.550, -.575, -.600, -.625, -.650,
-.675, -.700, -.725.

brett_miller@ccm.hf.intel.com (Brett Miller - N7OLQ) scrawled in
blood:

>The term regulator is usually in reference to voltage. When charging Nicads,
>you just have to make sure that the current is limited. The battery packs for
>the 3000, 2500, etc. have a little circuit built in to make sure the current
>does not go above a certain limit (60-80 mA). Voltage is less important when
>charging nicads. A cig. lighter adapter will do fine on these packs. No
>additional regulators or limiters are necessary.

I was thinking more of the way that the voltage on a car's electrical
system can go from 8 to 15 volts easily and often. Shouldn't that be
compensated for, as it would affect current?

>Q: Is there a problem if the battery is recharged partially (ie not to full
>charge)? once? repeatedly?
>How do you figure the recharge time if partially discharged. (700mah on 60ma
>trickle charger = 12 hours no matter what discharge?)

Generally there is no problem with partial discharges or charges. Usually if the battery is about 1/2 discharged and I need a full charge out of it, I will put it on a slow charger for about 10 hours. Slow chargers are best since they are very forgiving of overcharging. Doing partial charges or discharges every once in a while will have no detrimental effect on the overall life of the battery. It is not necessary to fully discharge a Nicad every time you use it. Now if you are using a 1 to 4 hour fast charger, then things change. Overcharging (the primary way to kill nicads) becomes a real issue.

Has anyone seen the article in the latest Worldradio that's titled:
"NiCds: Memory myth"? It is written by Dean Manley KH6B and he reports
there is no such thing as the memory effect in NiCads, claimed by Gates
Energy Products (battery vendor). Gates has run tests which show no
effect at all and claim that the myth was based on "one observation of
a single battery in a lunar NASA mission".

I have read (somewhere) that the so-called memory effect is caused
by overcharging the batteries.

Actually, I don't know who to believe at this point.

For what it's worth, I use an electric razor with Nicads, and after a few
months of daily usage (recharging continuously) it would diminish motor speed.
After disposing of several razors with this same failure mode, I decided
after reading the KH6B article that I would run the razor to nearly dead
state, then recharge it for 24 hours. After doing this, the razor has
essentially the same motor speed as it was new. Dean's article saved me $$.

Dave:

The GMRS is the General Mobil Radio Service. Years ago it was called Class A Citizens Band, as opposed to the Class D Citizens Band of the 27 mhz bandwith.

GMRS is on the 462 mhz band and anyone with $80 to spare for a 5-yr license may apply with the FCC to operate on these frequencies. Unlike CB, these radios are on frequencies similar to those used by police agencies and business.

GMRS used to be available for small business and personal business use. Licenses used to be granted for associations aw well, so many REACT groups who used to monitor Channel 9, the emergency channel on CB, set up GMRS repeaters in their commnities on 462.675, the emergency and motorist assistance frequency.

Since the FCC rule changes, however, one may only get licences for personal business use. Small businesses may no longer receive GMRS licenses.

Typical acceptable conversations are, "honey, I'm on the way home, do you want me to stop at the store for milk?" etc.

Many community groups still monitor GMRS or use it for patrol purposes, but under the new rules, each user must get his or her own license because, as mentioned above, association licensing is no longer allowed.

Radio Shack and other providers of GMRS equipment are no offering radios on frequencies adjacent to repeater pairs for low powered, short range communications i.e. those used on hunting and camping trips or car-to-car communications between family members on a long range trip, etc. While these low powered radios also require licensing for use, businesses are typically selling them to people who are UNlicensed and this is causing concern that GMRS may become like CB, unregulated and out-of-control.

In a previous article, sefrlw@aur.alcatel.com (Louis Sefranek) says:

>>
>> Well, right now there are no mods available, and the cell freq's
>> are locked out. Though, I use the scanner every day, and it
> ^^^^^^^^^^^^^^^
> |
>Iregularlly hear cell phone calls in the 806-956 MHz range Why can I
>hear them ????

That is most likely due to atmospheric annomilies. Basically, from what I understand about it is that the atmosphere changes frequencies just a little bit so that we could hear them. Plus the lockout does not include a small fraction of the older cellular phones that use freq's above/below the lockout.

(If I am wrong about the atmospheric annomilie, would someone please correct me because sometimes I don't even know if I'm right or not.....)

Thanks - Jim

> How do the Airlines own frequencies come into play here.

The domestic UHF frequencies are strictly for ground use: gate attendants, ramp vehicles, etc. The company frequencies in the aero band are used on the ground to talk to the company tower at the airport (what's the weather in Oshkosh, the cockpit thermostat isn't working, etc); and to communicate with company dispatchers while airborne.

The latter is done via a nationwide network maintained by ARINC, Aeronautical Radio, Inc (its international counterpart is SITA - Societe Internationale de Telecommunications Aero). The pilot uses the company freq., is received by the nearest ARINC site, and is patched through to the proper dispatcher.

In many cases the airline's local (airport) radio facilities are maintained by ARINC, and the 'local' dispatcher may actually be hundreds of miles away.

>___ Blue Wave/QWK v2.12

On the CHP thing, remember the CHP freqs are paired freqs, so the cars
are on a different frequency than the dispatch. A CHP channel such as
purple is actually 42.40 and 42.16 I myself have found CHP a little
quirky to listen to. Back home for instance, the CHP station just up
the road about 12 miles would be silent all day and I'd get the CHP
station 98 miles away in Santa Ana that uses the same channel as clear
as day.
Try 154.905, the vehicluar extender for the hand-helds, that way you
can see if there's anything happening and if maybe you have unaccurate frequencies.

>This seems kind of goofy to me. Is this true?

Believe it!

I am a paramedic/firefighter and my dept. is on an 800 mhz trunked system. All of our units have a portable unit and I carry mine on a belt holder. I have noticed many times, especially when in "fringe" areas that I loose the signal. If I go into the basement of the hospital I always take the radio out of the holder and hold it in my hand.

Cheers

Brian

From: casato_jc@atc.alcoa.com
Message-ID: <casato_jc-180495102823@132.226.103.38>
Source record: 258406

I recently came across a public service frequency in the 15X.XXX range that 50% of the time I can monitor it clearly, and then the next time they transmit, all I get is "buzzing/hash"-type interference. What gives?? It's apparent from the next transmission that the intended party got the message. So, what's happening the other 50% of the time that I don't pick up the voice transmission??

I've tried adjusting squelch and gain to no avail.
I've gone off freq. on both sides to no avail.
I've tried another scanner ... again, to no avail.

Engine noise ?? The actual exhaust sound or the static from the ingition system. If your refering to just the exhaust noise the a inexpensive setup would be a good set ear protection for shooting and the in the ear type headphones. I am an avid shooter and I tried this so I could listen to MRN at Rockingham last year. The results were wonderful. The earprotection I have is just a pair from a local sportng goods store, not the 5.00-7.00 models the 20.00 model. I just bought the SC-150 add a 15.00 pair of headphones total of 35-40.00 is a lot better than 75 and up.

>called "clipping". Is this a major expense to repair, of a minor adjustment
>under the hood.

The obvious thing to check is to make sure you are in the Wide FM mode. Your description sounds like NFM mode. The other thing that is necessary on some radios is to open the squelch all the way when listening to WFM signals. Another thing to try is to switch in the attenuator on the back. My guess is that it is not the signal strength, but the frequency deviation that is causing the problem. The deviation goes beyond the filter being used and so it gets clipped.

I know my answer wasn't very technical, but beyond these things it gets ugly.

> destruct button.

Mmm......not sure what you mean by that.

Early AR1500 did not have any form of "switch" - it was neccessary to
make a lead up to reset the CPU.

AOR then "upgraded" the AR1500 to the AR1500E version - together with
several internal improvements the "reset" switch was added. It also
provided a quick visual aid to see what model you were being sold/about
to buy.

If the AR1500 you own has a lead coming from inside the radio into the
battery compartment with a switch on the end then you have a AR1500"E".

The keyboard reset proceedure is in the rear of the supplied manual and
requires the "switch" in the battery compartment to be moved before you
start pressing buttons.

If you still don't have it I'll did it out asap.

They both have AM capabilities but the PRO-39 does not allow you to
"choose". AM for airband 118-136MHz & NFM for everything else.

The PRO-43 can be swithced AM/FM on any frequency within its coverage.

Other than that main difference is 220-400MHz military airband coverage
on the PRO-43 - not on the '39

I remember hearing this when the local police went digital (no, not trunked radio). I was able to pick up some voice transmissions until they finally moved to a totally digital system. Now all I can get is static and a bleep after the transmission ends. BTW they're using Motorola Systems Saber trcvrs.

This is a good point. I thought that the ham band on 10 GHz stopped at 10.5 GHz,
while police radar is normally at 10.525 GHz. Therefore trying to pawn off
an emitter as a ham CW transmitter would be almost a self-admission
of guilt of out-of-band operation.

For Sale:

Uniden BC 100xlt Scanner:
Portable hand-held scanner

Band Coverage: 11 Bands

Frequency Range:
10 meter "Ham" 29.0-29.7 MHz
Low Band 29.7-50.0 MHz
6 meter "Ham" 50.0-54.0 MHz
Aircraft 118-136 MHz
Military Land Mobile 136-144 MHz
2 meter "Ham" 144-148 MHz
High Band 148-174 MHz
Federal Government 406-420 MHz
70cm "Ham" 420-450 MHz
UHF Band 450-470 MHz
"T" Band 470-512 MHz

Channels: 100 channels (10-10 channel banks)

Scan Speed: 15 channels per second (scanning)
25 frequencies per second (search mode)

Display: Liquid Crystal

Antenna: flexible antenna included

Connectors: antenna, earphone, DC power

*** Features ***

1. Scan, push to scan all frequencies programmed into memory.

2. Mannual, Press to progressively advance though the programmed
channels, or for direct channel access.

3. WX, instantly searches all seven NOAA weather frequencies until it
locks into the active frequency in your area.

4. Delay, allows you to add a two second delay to any channel to you
won't miss any action.

5. Lockout, to skip a programmed frequency not of current interest.

6. Priority, program hte first channel of each bank to be monitored every
two second for important transmissions.

7. Key Pad Lock, to prevent any accidnetal entries into the key pad.

8. Limit, Sets the upper and lower limits for the automatic search and manually advance through the search frequencies.

9. Search, Automatically searches for new frequencies.

10. Hold, push to stop the search process to monitor a frequency.

11. Key pad, for entering new frequencies and accessing programmed frequencies directly.

12. 10 individual Banks for storing groupings of 10 frequencies.

13. Illulminated Liquid Crystal Display, a large LCD display that can be light up with the light feature

14. Detachable Rechargeable (Ni- Cad) Battery pack, provides full power scanning and allows direct and convient recharging.

*** Further Info ***

I have the origional box, documentation, and instruction packet. Also included is the earphone, charger and leather carrying case.

The unit is used but is in very good condition.

If you are interested you can reply to me directly since I very rarely read this group: jbb@hopper.unh.edu

I am asking $100.00 (payment by money order) firm and I will pay for shipping anywhere in the US via either USPS or UPS.

Thanks,
Jamie.

To the best on my knowledge, they use the same frequencies as the
"regular" BSO comms (20 trunked frequencies shared with other county
services).

If you need a list of those, let me know & I can mail them to you

For anyone interested in airband scanning, the April 1995 issue of the
British "short wave magazine" has a lot of information. There's an
article on the development of aircraft radios including SELCAL (Selective
Calling), another on building an active antenna from Howes Communications,
and another describing the start-to-finish flight communications on a
747 flight from London Heathrow to Logan International in Boston.

Rocky

The best way to find hidden frequencies is by using your search function on your scanner. If your scanner doesn't have search you should look for one that does. Take your local police frequency and start your search a megahertz or two lower aend it a few meg higher. When they say go to channel 5 start your search, chances are they will be in the same frequency band, not always though. Also additional channels may be simplex (Not going through a repeater) and you may have to be very close to hear them.

Besides finding new freqs searching is great fun.

Does anyone know how to do hard reset on this scanner, mine seems to have a bug or some thing at this point, after being left on all night it had appeared to frozen on one channel, when I powered off and on, my result was a blank (but well lit) LCD panel, there is no characters on the screen at all, It functioned well until this event. Maybe there is a key sequence to clear the cpu of any errors it may be holding in memory. Any input to this matter would be appreciated.
Thank you.

Yes there is. I built one for about $7, the plans were in the Aug 93
issue of Monitoring Times. Bill Cheek published it and it may be in his
new book of scanner mods.

The Grove Scanner Beam is nothing more than a T.V. antenna mounted
sideways so the polorazation is vertical. Go to Radio Shack and purchase
a T.V. antenna for $25 mount it sideways and viola you have a scanner
beam.Mine works just fine..

I don't have the data in front of me, but I'm pretty sure that K-band
radar (24.125 GHz?) falls inside the authorized amateur band from 24.0 to
either 24.25 or 24.5 GHz. Anybody got part 97 handy to clear this up?
This would suggest that using that surplus K-band radar unit would not
constitute an out-of-band condition. I've seen lots of guys do it. Of
course, identifying station call sign with one is kind of tough :-)

892. Scout frequency counter

Newsgroup: rec.radio.scanner
Date: 1995-04-19 00:00:00 UTC
From: lbutler@umcc.umcc.umich.edu
Message-ID: <3n33l0$94m@umcc.umcc.umich.edu>
Source record: 258181

Sorry it seems my reply to this topic only carried my gigniture. I'll try again.

The "Scout" is a frequency counter with a twist. It's small enough to carry in your shirt pocket(About the size of an alpha numeric pager). If purchased with the stealth antenna(very short) nobody will ever know you're scouting for frequencies). It also has 400 memory channels to store all your hits to. When hooked up to a Radio Shack Pro base unit with the Opto 456 board installed it will automaticly tune the radio to the recieved freq. This also works with the Icom R-7000 and 7100 when interfaced via the Ct-17 inteface box.

Now a frequency counter is a device used to find those elusive mall security freqs or any other hard to find freqs. The catch is you must be in the transmitting antennas NEAR FIELD. Near field depends on many things such as Transmitter power, frequency, antenna type and antenna gain. It also depends on which antenna you use on the frequency counter, one tuned to the band your searching will increase your chances.

I hope this helps the gentleman who asked what and where and how he'd use a frequency counter.

All cars and trucks electrical systems have a voltage regulator which
maintains the voltage about 13,5 volts. It may go lower under heavy loads
such as A/C headlamps radio and wipers on at the same time. It will NEVER
go to 8 volts unless it isn't functioning. 8 volts is not enough to power
todays fuel injection control units or most other control units. 8 volts
will not start a car either. Most automotive testing if not all isn't
performed at that low a level since the vehicle can't function there.

They are used for VHF television channels 4 through 6, I believe. If
memory serves, channel 4 is 66-72 MHz, 5 is 76-82 MHz, and 6 is
82-88 MHz.

Question: Has anyone hooked their cable TV feed into the antenna port
of their scanner?

I just bought a Uniden SportCat (the dopey yellow one) because it looked like a good price -- $179 at Service Merchandise.

Having looked at and handled the RS Pro-51 and 62, I must say the Uniden seems to be very cheaply made. Who makes the Radio Shack units? They seem to be more robust in build quality...

Electrically which is the better radio? My application is eavesdropping on autoracing drivers and crews, any advice specific to that use?

It is difficult for me to differentiate between the various RS 200 channel units. Anyone familiar with the 51/62/43 care to comment/summarize? I would appreciate it.

On some systems, like the "Securenet" system we use for certain applications, the radios will
receive encoded and noncoded traffic even if the individual operator has not selected secure
xmit mode. So you might hear one side of a conversation in clear text and the other side encoded.

Securenet is not a product limited to Sabers. We use it on MSF5000 base/repeaters (digital capable) and Spectra mobiles, as well as Saber hand helds on our system.

As a news person, let me relate what I know from personal experience.
I don't really know if they won't ask less questions, actually I think
that it might be the other way around, i.e. asking about an operation
in progress that was heard on the scanner. As to whether they like us
listening to them, it depends on the situation. Everywhere I've worked
we have had a scanner on 24 hours a day, to listen for breaking news
and such. Usually the authorities don't mind things like that. But one
time I was covering a SWAT standoff and the comand van told everyone
"All be advised, the media is listening to us." over the radio so that
they didn't say anything that they didn't want us to hear. On another
assignment which involved a rescue of lost hikers, they made it a
point to keep us from hearing something "Rescue 35, Rescue 63, are you
10-35 media?" and, we were escorted out of earshot from the radio.

One thing that we always are wrestling with is whether or ot to use
information off the scanner. Is it realiable, legal? Many times you
get someone who is somewhat excited getting a bit overeggagerated.
Remeber the plane crash in L.I. New York a few years ago? That went
out as a 747 down, not a smaller plane which it was.

>165.1625 - 165.165

Set the frequency step to 12.5. Rather than store the actual frequency,
scanner seem to store the step and the multiplier to save space. Since
your frequencies are multiples of 12.5 Khz, and the scanner's set to
5 Khz steps, they don't stay the same.

If you get anything from plugging your cable into the ant. port, it
will be audio/video intended for cable television. But wouldn't it be
nice if it became one big antenna? Just doesn't work that way.

The phone number for Signal Intelligence is 1-408-926-5630.
The software they sell is Scanstar Commercial They have another
product called Scanstar Profesional but it does not have a
graphical interface and is missing some other feature I like. They also
have an info number 1-408-258-6462 (BBS).

After a 7 month hiatus, the Oregon State Police are back in the air...With a vengance. Today they had 10 units and the A/C on I-5 between Halsey and Corvallis nailing people with our famous $500 speeding tickets. Trucks were especially targeted because of the even larger fines. Their tactic today was to radio an officer on the ground who was hidden, usually on an on ramp or behind a bridge support. Once you're targeted the cop waits for you to go by and then nails you with Laser. A few were using radar but it seems that there were 2 units that had laser. The freq that the air unit was on was 154.665. There seemed to be a car to car unit but I couldn't get it. 155.4750 is the staewide O.P.E.N. freq. They like to operate on that freq also.

It sure is. A human body absorbs radio signals pretty effectively. In order to get around this, I've seen guys at hamfests walking around wearing steel hats with rubber ducky antennas mounted on top, connected to their belt-hung HTs by a short cable. (Never seen one with a 1/4-wave ground plane up there, though.)

>If you don't know how to drive, get the fuck off the road.

You need to increase your vocabulary, Christian. And are you
the one who decides who is allowed on the road and who isn't?
I'm beginning to think you're a very dangerous driver.

>: I was a fireman back in SoCal and rolled on many nauseating
>: traffic accidents whose sole cause was speed. Shall I describe
>: what's left of a body after it impacts a center divider at 90mph
>: (after it's flown through the windshield thus causing the head
>: to seperate from the body)?

>Wait a minute... Nobody ever said that speed wasn't related to fatalities.
>While speed does NOT affect the accident rate is (sic) does increase the
>fatality rate. Everything has advantages and drawbacks...

Speed does not effect the accident rate since most are not speeding.
But if we look at just the high speed drivers, then their accident
rate is *much* higher than the speed-limit drivers.

>: Get out of your dream world and just do the speed limit.

>Wake up and smell the 90's!
> Christian

When you eventually have your fatal accident, please don't involve
anyone else. One run I made was to sweep up the pieces of a family
(severed limbs, charred torsos) that was hit head-on by someone
like you.

The PRO-232 is an inexpensive interface that lets you control the
scanner from your computers keyboard and also lets you create, save and
upload and print databases using the included software. Uploading
database info to the scanner programs all or any of the memory channels.
Easy to install. Connects to your PC computer serial port.

Leave me an e-mail message if you want more info...

938. Re: 66-88 MHz

Newsgroup: rec.radio.scanner
Date: 1995-04-19 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <3n1lvf$d20@hopper.acm.org>
Source record: 258253

rgallim232@aol.com (RGallim232) asked:
> ... what the 66-88MHz are used for and why they are locked out?

From the file fcc.allocations
on ftp://oak.oakland.edu
in /pub/hamradio/docs/misc

50 - 150 MHz
50.000 - 54.000 Amateur (6-meter)
54.000 - 72.000 Broadcast TV chs 2-4 (6 MHz steps - FMw)
72.000 - 76.000 (various)
76.000 - 88.000 Broadcast TV chs 5-6 (6 MHz steps - FMw)
.....

The 72-76 MHz range includes remote control, land mobile, point-to-point,
paging, NavAids, etc. The 54-88 MHz range is omitted on many scanners since
most cannot handle the wide FM signal used in TV audio.

Mike,

I've used my 3000 day and night for a week now and have only heard ONE "image" (other than cell) and it was wiped out using the Atten. In fact I did side by side comparisons with my 2006 and the 2006 (which had excellent image immunity) has far more spurious signals than the 3000. The 3000 is also measurably more sensitive than the 2006.

Wish I could help!!

> ... why is one triple conversion scanner able to ... and others ...

Well, there's triple conversion and then there's triple conversion <g>.
Some manufacturers include a block conversion stage ahead of a conventional
double conversion rcvr. While it may technically be 'triple conversion',
its effect is to shift all the high frequencies down, images included. The
question you have to ask of any scanner - was it designed by engineers or
the marketing department?

945. [FOR SALE] RS PRO-2006

Newsgroup: rec.radio.scanner
Date: 1995-04-19 00:00:00 UTC
From: dmorisoli@aol.com
Message-ID: <3n2556$h34@newsbf02.news.aol.com>
Source record: 258260

I recently purchased both a PRO-62 portable and a PRO-2006.
Since I am a railfan and do most of my scanning on the road the 62 suits me fine for all my needs. Accordingly, I am willing to sell the PRO-2006 to the highest reasonable offer. The radio has been used less than 8 hours. I have the original box. Cellullar mod completed. Send offers or questions to me by e-mail.

Thanks,
D. Morisoli

946. BC 890XLT scan order disable?

Newsgroup: rec.radio.scanner
Date: 1995-04-19 00:00:00 UTC
From: giles.26@osu.edu
Message-ID: <3n27k4$p1c@charm.magnus.acs.ohio-state.edu>
Source record: 258261
Cross-posted to: rec.radio.scanner,alt.radio.scanner

On the 890XLT, the channels are sorted in each bank in order of ascending frequency when in SCAN mode. Is there any way to disable this feature? It would help for scanning trunked systems. Thanks in advance!

IR>Can someone tell me what the 66-88MHz are used for and why they are locked
IR>out?

IR>Thanks in Advance
IR>Ron

Ron,

According to my listing, some of which I know is accurate, the other,
well, I'll have to trust the knowledge of the writer.

54 - 72 MHz TV Channels 2 - 4
72 - 76 MHz Manufacturing, Remote Control, Eavesdropping Bugs, etc.
76 - 88 MHz TV Channels 5 - 6

Below that is the 6 meter Amateur Band and above is the FM Broadcast
band. 50 - 54 and 88 - 108 MHz respectively.

Hope this helps!

Lou

>
>cya l8er... -=lArRy=-

Man, I hope he didn't take your suggestion and buy one of those.
Little biased towards the CE/HB-232 are you?

Man, mention the TWO options to the guy so he can make a choice!

Lionsden:
There are currently two types of RS-232 interfaces. They each
have their pros and cons. The first one developed was by
marketed by Bill Cheek. This interface is nothing more than,
as others have put it, "A glorified button pusher". What's
nice about this option is that you can completely manage
your memory banks of the scanner.

The most recent development has been by Opto Electronics. This
unit (OS456) takes complete control of the front end. When this
happens, your computer is basically controlling what is to be
scanned, etc.

With the HB-232, since the scanner is still the controller, you
get the stock scan rate. With the Opto456, proper software
and computer, you can get 50cps! Additionally, there is quite
a bit of software out there for both interfaces. I am familiar
with PROBE, and Scan*Star Commercial. I have attempted to use
ScanWear, but my patience ran out after wasting about 4 hours
trying to get it going.

It would be nice to see what others here use for the interfaces
and what they think....

FYI...Opto and some software developers will be at Dayton,
offering show specials on hardware and software. Also, pick
up a copy of Monitoring Times and Popular Communications as
there are a couple of ads in each from various dealers.

Hiran,

I Don't Know of any Mods, but thought I might mention that the PRO-26 is the new Uniden Unit and the pro-60 is the new GRE Handheld that will be comming out soon from RS at $349.

I am thinking of buying the Pro-26. How do you like it? Do you notice any intermod problems in VHF Hi?

Thanks,

Frank

If you get one, you can make the scanner resume scanning when it's paused on a signal for 5 seconds by pressing "MW" which is not in the manual -- at least not the English one. (Thanks to Richard Crisp for finding this in the Japanese manual, I believe it was.) Really intuitive keypress.

959. Pro-2038?

Newsgroup: rec.radio.scanner
Date: 1995-04-19 00:00:00 UTC
From: fqc9570@is.nyu.edu
Message-ID: <3n1mlv$gj7@cmcl2.NYU.EDU>
Source record: 258274

I saw pro-2038 today at Radio Shack. As most of people knows, the sales person doesn't know anything about its specification.

Could anyone tell me its specification--freqency coverage..etc.??
Or could anyone tell me about any article available online??
RS is having a lot of choices of scanners, but they don't have catalogs to give out for customer. I will appreciate your response.

If I were not mistaken it should be pro2038 (or may be 2036??)
It is on sale till April 29 at $189. I have to add 8.25% for tax, though.

Thanks!!

Just like a TV needs to be hooked up to the cable to get cable
channels, is your scanner hooked up to the cable? Cable is a closed RF
spectrum (in theory at least) and should not be receivable off the air.

Don't bet on getting a mod. Any scanner manufactured after 4/94 is not
capable of restoring the complete 800 Mhz band.

BTW, there is going to be a Pro 60. Stay tuned for further developments.

Source record: 258087

DPL is not the thing. It is true that a trunking system uses a digital connect tone but this is system wide. One tone does all. It is also not the same as the DPL used in conv systems. However if you still need to decode pl/dpl/ctcss I woukd look at the one made by Optoelectronics. I have the one made by Connect systems and it works well however if you have PL and DTMF at the same time it will only see the DTMF. Be prepared to hock it up to the discriminator if you wish to decode DPL. Good luck!

It is hard to talk about this without being misunderstood.
There is such a thing as memory efect, but it is rarely, if ever, the reason you and I experience problems with our Nicads. Manufacturers, vendors, salesmen, all help to spread and strengthen this memory effect hysteria. Without intelligent chargers, Nicads are not user friendly. Most manufacturers that make chargers would rather build a cheap charger and have you believe your batteries died an early death because of the memory effect than to realize that it was the charger that ruined them. Vendors and salesmen just don't know any better. Take a look at all these products that you can by to "refresh" or dishcharge your batteries to avoid this memory effect! It is hard to convince people that the memory effect is not what is responsible for killing their batteries. The reason these new "refresh" chargers seem to work better is that since they drain your battery first, you avoid the real killer of batteries: overcharging.

Sure, that would work. I was being sarcastic, and I suppose it showed.
I have tried to justify to myself how, if ever stopped and
questioned for using one while driving down the highway, I could pawn it off
as something permitted under amateur rules, and I think I would lose that
argument. Even if it wasn't causing interference with "officials" ... I
don't think that setting off radar detectors would be interference - aren't
they Part 15 devices which have to accept interference, blah blah blah ...?
I think if pressed, its continued use would violate a bunch of Part 97
rules ... like one-way communications. It also has the *potential* for
causing problems ... I fire it at some nut driving about a hundred,
he slams on brakes, loses control, hits someone else. I think a civil
jury could be convinced that I was at least in part to blame.

Of course, maybe I could plead that I was not intending malice ... that
I used this device, which xmits in the amateur band, as a home-brew (?)
digital speedometer ... hmmm... And, if it's done intermittently
it might (big leap here) be considered one of those "test" signals that
is permitted which is not intended to be "communication" . . .

I think I'll continue to keep it out of sight, though - maybe keep it
mounted to rear deck under a towel, or on the dash inside an empty
tissue box...

The Radio Shack model ($299 in the catalog, the one with digital
spread spectrum, actually made by Escort (says so on the handset))
sounds like a modem, and you can hear this on 4 or 5 differennt frequencies
at *or about* the same time (multiplexed?). They CLAIM to use encryption.
I just wonder, can one phone pick up another?

Want the band plan corrected from UK to US standards for your AR8K handheld?
Don't want to spend $800 to $900 (that's what the Canadians are charging)
for a cellular capable radio? Want to avoid the TEDIOUS task of entering
freqs for any US city or state? MEGA-BYTE Enterprises can program all
this and more into your AR8K to take the HASSEL out of scanning . For
more info, send mail.

980. Re: Cable TV Audio?

If I understand your post correctly, what you may be overlooking is that the broadcast tv channels are broadcast (and therefore receivable by your scanner) while the cable tv channels are *not* broadcast over the air (and are therefore not receivable by your scanner).

Have you ever seen those radios designed to receive the audio from tv broadcasts? Instead of frequencies, they usually have channel numbers. Channels 2-6 are tightly clustered, with a big gap between 6 and 7, and then channels 7-13 appear--located fairly close to one another. CASIO hand-held color tvs are the same way. Those radios and tvs are probably the way they are because they use tuners with linear frequency scales. The low-VHF tv frequency assignments are: ch2:54-60MHz; ch3:60-66MHz; ch4:66-72MHz; ch5:76-82MHz; ch6:82-88MHz. [A poster yesterday said that 72-76MHz is allotted for remote control devices, etc.] But 88-108MHz is FM radio, 108MHz+ is for aircraft, ..., and channels 7 and above are assigned to frequencies above 162MHz.

Under normal circumstances, my CASIO hand-held could not pull in cable signals. When I unhooked my girlfriend's cable source from her VCR, put a Rat Shack adapter on that coaxial cable, and plugged that adapter into the CASIO antenna jack, I was able to view the first half of her cable stations between ch6 and ch7 on the CASIO. Alas, given the CASIO tuner, I could not determine what cable station was using what frequency. All I know is that they fell between ch6 (88MHz) and ch7 (162MHz+).

The next time I'm at her place with time on my hands, I intend to patch that cable source into the antenna terminal of my recently acquired PRO-43. I don't know if that scanner covers those VHF frequencies that cable uses, but I shall soon find out. Has anyone done this? What results did you get?

981. AR2700 - Anyone seen one?

Well, funny that, I just got my BCT7 Tuesday. I don't have any mod info,
but I do no that I tried the stock ant. and it sucked, so I rushed down to
R.S. and bought an adapter for my C.B. ant. I know that a dedicated
scanner antenna would be better, but the C.B. ant made a world of
difference. Also, just for fun, I have been trying out cellular
frequencies, and I can get every one that I have seen posted here in the
last 2 days. I thought they weren't supposed to sell them that way anymore.
Just for refference what excactly is the frequency band that I am not
supposed to get? --

>
>Does anyone know anything about this?

Motorola Astro's are their new radios. They are digital capable and many
on scene command posts will be secure as well as internal affairs and
detectives. The main dispatching will remain in the clear for now. The
new handhelds are 120 channels. L.A. has around 60 some odd channels and
the remainder will be programmed with the surrounding agencies. The lack
of city to city communications after the last earth quake prompted the
extra channel capacity.

So the newspapers are partially right as usual. Some of the system will
be secure and some not.

I suppose another way to ask the same question is:
Which is better, Uniden or GRE scanners (although it looks like Uniden's
marketing department let engineering look at the 3000 & 9000 before shipping
them).

Yes, that is correct. Uniden probably didn't want RS to have a better scanner than their 3000XLT so they only put 200 channels in it. What a bummer - 10 banks of 20 just doesn't cut it any more.

994. Uniden SC-150 vs Pro-39

Newsgroup: rec.radio.scanner
Date: 1995-04-20 00:00:00 UTC
From: jbd@spcfs2.nsc.com
Message-ID: <D7CKKy.AKD@nsc.nsc.com>
Source record: 258146

I bought a Uniden SC-150 for $172 yesterday, haven't opened the box yet. I just dropped by R/S to pick up a few items and I see that they have the Pro-39 for $199. Other than 100 more channels, and a nicer plastic package, does the Pro-39:

o offer any benefits as a receiver
o better programmability
o cell mods

How about a Pro-62 for $219 or a Pro-43 for $249? Which would you choose?

Regards...

Since we're on the subject, at the Foothill swap meet I saw a guy with a 4
element quad for 440 mounted on his hard hat!

> Really wondering...

It varies. Bare bones minimum is $325. It grows exponentially. After
75MPH you're wallet is history---$512. No front plate= $512, Jay walking=
$90. But you could always plead down to "Posession of a contrlled
substance (Less that 1 Oz.)" it's only $250.

999. What is triple conversion

Newsgroup: rec.radio.scanner
Date: 1995-04-20 00:00:00 UTC
From: Vaughan.Huska@odxabbs.tor250.org
Message-ID: <be6_9504201148@tor250.org>
Source record: 258151

Hi.

You'll have to excuse me as I'm not an engineer or a technical wiz of any sort when it comes to this type of question, but I'll take a stab at it.

From what I got when this triple conversion subject was explained to me as my Uniden 2500 XLT has triple conversion, it basically means that the signal that the scanner receives is "filtered" three times of any unwanted signals and hones in on what it's supposed to receive before it turns that signal into audio.

Triple conversion is very necessary in metropolitan areas, but it's not the be-all-to-end-all. I still get some intermod now and then here in Toronto. I'm told that my scanner is too sensitive to begin with and would be better suited in rural areas.

I'm not saying not to get that scanner void of triple conversion, I would recommend that you do get it with triple conversion as it will cut significantly, the noise and intermod that you might be subjected to without triple conversion.

Cheers,

Vaughan Huska

Source record: 258153

Here is a neat NEW toy.

Model C508A from Standard.
It is a amateur dual band handheld.

I mention here in scanners for a couple reasons that some scanner guys
might want to check out.

First approx. size is 2 1/4 wide X 3 1/2 high X 3/4 depth.
Freq coverage for receive 100-199 MHz
300-399 MHz
400-519 MHz
700-867.9875 MHz
896-999 MHz

60 Memory channels with scan.
You can scan A block(bank) at a time of 10 channels in a Block.

Also some will like it has Pl tone encode AND decode built in.
Power is by TWO AA batteries not supplied.
This can make for a very neat and very small scanner.

Oh vhf air band is AM.

Price 269.95
E-mail for dealer info on this STD model

>>scanner... or a scaning pager.

>Your Advisor is a rock bound receiver.

>Curtis Wheeler San Ramon, CA (cgwh@chevron.com)
>KD6ELA / GROL PG10-25691 / Pvt. Pilot ASEL

Actually, the advisor is also available in a synthesized version. The
programming software then allows entry of the receive frequency as well
as multiple capcodes and alert sequences.

Most paging providers do not purchase the synthesized version for three
reasons:

1- price
2- ease of changing vendors (no need to order crystals)
3- lower battery life

Source record: 258159

IM>rgallim232@aol.com (RGallim232) asked:
IM>> ... what the 66-88MHz are used for and why they are locked out?

IM>From the file fcc.allocations
IM> on ftp://oak.oakland.edu
IM> in /pub/hamradio/docs/misc

IM> 50 - 150 MHz
IM> 50.000 - 54.000 Amateur (6-meter)
IM> 54.000 - 72.000 Broadcast TV chs 2-4 (6 MHz steps - FMw)
IM> 72.000 - 76.000 (various)
IM> 76.000 - 88.000 Broadcast TV chs 5-6 (6 MHz steps - FMw)
IM> .....

IM>The 72-76 MHz range includes remote control, land mobile, point-to-point,
IM>paging, NavAids, etc. The 54-88 MHz range is omitted on many scanners since
IM>most cannot handle the wide FM signal used in TV audio.
IM> /* barry /&

something you may not have known, barry, but in europe the 66-88MHz band
is used extensively for land mobile radio by police, fire, medical
services and the like. the reason it's typically omitted from US
versions of scanners is due to it's lack of use over here for 2-way
communications.

From: lonniel298@aol.com
Message-ID: <3n784n$dpk@newsbf02.news.aol.com>
Source record: 258163

Yes, it will both on transmit and recieve.
You can also order the radio from:
Sports-Comm Distributing
P.O. Box 36
Scotts Mills, Or. 97375
Phone: (503) 873-2256
Fax: (503) 873-2051

I have one of these radio's and they work GREAT!
And at the price it can't be beat.
Sports-Comm Sells them for $239.00
Also be aware the place that had them for $199.00 might not have them
to sell. Make sure they have them in stock before you order.
I can vouch for Sports-Comm however.

1017. Re: Pro-39 and Pro-43??

Newsgroup: rec.radio.scanner
Date: 1995-04-20 00:00:00 UTC
From: c570074@showme.missouri.edu
Message-ID: <c570074.67.2F95AB47@showme.missouri.edu>
Source record: 258169
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Add one more thing to the list of differences between the Pro-39 and Pro-43. According to the catalog, at least, the Pro-43 air band only goes down to 118 Mhz, whereas the Pro-39 goes down to 110 Mhz. This isn't really all that important for most, as almost all aviation voice communication takes place above 118. Below 118 is mostly radio navigational aids, but there are certain weather and Flight Service Station frequencies that use the same navigational frequencies for voice communication, also.

If you're looking to hear certain weather/FSS frequencies (which you'll likely only be able to pick up in the air), this is important. If you want to listen to planes & pilots, you're not missing a thing.

Don't let anyone tell you that business users are not alowd to use GMRS.

I run a licensed GMR repeater here in Cincinnati and funding for the tower space (at $260 a month) is done primarily by my LICENSED business users. Most all business users of GMRS realize the advantages of where they are at and don't dare let their licenses expire. Of course it is true no more business licenses aren't issued anymore BUT those that are grandfathered can and will still be legal to continue use of GMR.
If it wasnt for these clients I would be forced into relicensing the repeater on a nother radio service. Family and occasional users just don't generate the revenue for maintaining most "big gun repeaters".

Of course my business customers aren't channel hogs ...Everyone gets along with each other very well.

So just to keep the story straight....I hope "newbies to GMR" don't try to come aboard overnight, hear a business user AND try some bullshit "Hey get off of there, cause you ain't legal" type of stunt because in the long run you might be cutting your own throats (unless you can cough up prime tower rent and system maitenance fees)

Here in Cincy, business and personal users of GMR can and do work together.

I know elsewhere they don't but thats their own ignorant fault.

1021. Active Federal Freqs in Maryland?

Well, I guess it depends on where you are. In the Colorado Springs
area, for example, there are some GMRS repeaters but its still
easy to find a lightly used frequency. Even if the "standard"
frequencies are occupied by repeaters in your area, you could use
the "interstatial" <likely spelling error> frequencies for
simple/local handheld communications.

Your mileage may vary.

RC> Do the police and emergency people like the news to listen to scanners
RC> (thus the newspeople won't ask so many questions?), or are bothered
RC> by it (newspeople still get in the way and waste time?)

I remember a few years ago there had been a riot at a nearby federal prison, and I was simultaneously listening to the local radio station as well as my scanner. Well, the radio sta. wasn't telling me much, and finally, they said that they were just sitting back listening to their police scanner.

Sheeze, why didn't they just stick the scanner in the mic jack? (Just kidding, it's illegal.) As for the OKC incident, I just talked to someone who was injured in the blast...I don't know what kind of gathering sources they are using, aside from the regular press conference. I'm sure they're using police scanners, or some of them are.

... But soft, what light through yonder tagline breaks?

The Panasonics use a form of speech inversion, so the communications are only secure from the casual listener. I have one of these phones and was not able to decode the speech using the common SSB trick, but there are probably descramblers out there.

Yes, they would have to be quite stupid to make it sensetive to the cell
frequency. A more likely scenerio would be to use a cell phone in the
bomb that just required you to call the right number and enter some DTMF
codes. Cutting off cell service would eliminate this threat.

>I have an external antena on my roof.

Besides some pretty high-tech filtering, your best bet would be to get a
directional antenna with a narrow beam width. As long as the two signals
were not coming from the same direction, you could point your antenna at the
weaker one and pick it up. However, 46/49 MHz beams are not too common (and
not too small either). A corner-reflector type antenna might do the job ok if
you wanted to build a stationary antenna.

>transmission with it beeping so damn much.

That is the low battery warning. The batteries are on the verge of being dead.

When audio is being produced, the current draw is higher and therefore tripping the low battery warning. When it is silenced, lower current is drawn and the voltage comes back up. Try out a brand new set of batteries.

If you are using Ni-Cads, one of them might be bad and the others OK, after a complete recharge, one of the cells may still be ZERO volts, giving the low battery warning signal. Use a battery tester to find the bad cell and replace it.

Hope this helps.

Best Regards, Keith

hI cHRIS,

The pinouts are as follows for the 16 pin connector.

Pin 2 - TX Audio
Pin 3 - PTT
Pin 7 - Ground
Pin 11 - Receive Audio

I
I've used the above connections for various projects ranging from repeater controller connections to Packet TNC. Hope it helps. As far as the MIC jack, I'll look it up. You'll need the Radio Service Software which you can purchase at Motorola and a R.I.B. box which translates the info from the PC to the levels needed for the radio. Motorola and other companies make that.

The Swagursat uses the 10.7 mHz IF output. It does seem to be a lot of $$ for the unit, but I have priced out filters and they are not cheap for this not common bandwidth.

The Swagursat converts the 10.7 signal to 455 kHz, and then applies the ~40 kHz filter before the detector. As shipped, mine had a response about 3 kHz low. It was a simple adjustment, however.

If the IC-R7100 follows my R-7000 design (I don't see why not) it has a 10.7 mHz IF on FM, and you can replace whatever filter you don't expect to use with a ~40 kHz unit. They are about $100.00. I have seen them offered by Spectrum International, but a few years ago they had prices that seemed pretty high (around $150.00).

The Swagursat is by far the easiest way to do it. I am using one, and once adjusted it has proved out quite well.

There has been much discussion on the Highway Zapper issue as of late. To catch everybody up on what has been discussed I am compiling a list of some of the highlights of this discussion from the past month or so from various sources on and off the net.

--- What is a Highway Zapper?

A Highway Zapper, also known more loosely as a radar activator, is a small garage-door-opener-type of device that, when the button is pressed, sets off radar detectors that some drivers use to attempt to avoid tickets. Naturally, if the other driver thinks that they may be going too fast, will slow down to normal speeds. They are generally available for about $50 and run off a 9v battery. There has been some questions about legality of using these devices as well, but it looks good if reasonable power limits are used. There are also some alternative things to think about using for those that want to home-brew their own radar activator.

This is the point where most everybody has an opinion, and the discusison falls into a flame war about speeders. We aren't going to do that - it's been done to death. The basic points to these arguments are 1) speeding is bad 2) stopping people from speeding is bad.

--- Contact Info on Highway Zappers:

TRANSEL TECHNOLOGIES
123 East South Street
Harveysburg, Ohio 45032
1-513-897-3442

ELECTRONIC RAINBOW INDS INC

PO Box 826
Brattleboro, VT 05302-9937
1-800-732-9976
Product Number AXT-10
$49.95

--- Other possible sources for those that like to do a little digging:

There was once a magazine construction article which described how to make a small 10.525 GHz transmitter with a strip antenna, which would set off X-band radar detectors within a half-mile or so. Since then a couple of companies have offered kits (pre-assembled or build [AND **TUNE**]

yourself versions). Cruise through electronics and ham magazines for ads from Innotek, Electronic Rainbow ("The Zapper") and JDR Microdevices (a computer parts outfit who are reselling a lot of the Rainbow kits).

--- Other related ideas:

The City of Menlo Park, CA has acquired a bunch of handheld police radar units which it will loan out for a week at a time to private citizens living on streets with speeding problems. The individuals using the radars can write down the license numbers of particularly egregious speeders and the police will send out letters notifying them they've been observed speeding in a residential district and asking them to slow down in the future. I guess there's nothing better to set off a radar detector than a real radar transmitter. For someone who lives on a winding two-lane road having numerous residences, lots of children in them, 17,000 cars/day going past, a 35 mph posted speed limit, an 85th percentile around 48 mph, and absolutely no enforcement, this thread has generated lots of useful ideas.

Most x- Band 10 Ghz microwave transmitters work real nice.Check nuts and bolts and you will see some discount 10Ghz microwave for video.

I have a couple of surplus dual-tech (PIR/microwave) motion sensors that I'd like to use to "test" radar detectors with :-). By powering them with the specified 12VDC, walking around the room, and watching the indicator lights they both seem to function. The horns are self-contained cast metal assemblies having a cavity with an electrical part (Gunn plexor diode?) stretched across them. One terminal protrudes through the casing and is connected to wire having a positive voltage. There are small screw adjustments, I assume to be used a fine tuners, that are glued in place and intact. Both seem to have a pot used for microwave sensitivity adjustment.
My questions:
1. Although both microwave emitters are marked 10.525 GHZ, they don't register on a working radar detector at any distance at any setting of the pot mentioned above. Why?
2. How do I get the intact unit to trigger a radar detector?
3. What parts do I remove, and how do I wire them, to use the horn assembly separately?

I�ve heard of people getting surplus motion detectors from supermarket sliding doors and hooking them up to do the same thing. They operate at 10.525 GHz - the same as X-Band radar, and are usually 12vdc to boot.

--- An interesting, but misguided reply I got regarding the Highway Zappers:

�Any transmitter over 100 milli-watts outside of citizen's bands is by F.C.C. rules illegal unless licensed. And anytime interference with a police radio/equipment is experienced - the offender is risking whats the usual charge from interfering with law enforcement.... Obstruction of justice.... N6RKY
P.S. You might want to review the F.C.C. rules part 13 for that....

FROM THE GENERAL RADIO TELEPHONE OPERATOR LICENSE MANUAL by W5YI with WB6NOA which is available at Radio Shack....
Pg 12
These listings only describe when radio OPERATOR licenses are neccessary. Before you operate any radio station, make certain that the station is licensed as required. CB and Radio Control radio stations do not require individual station licenses.
The holder of a commercial radio operator license or permit is not authorized to operate amateur radio stations. Only a person holding an amateur radio operator license may operate an amateur radio station.
WHAT DOES THIS MEAN????
Most radar frequencies are shared with the amateur radio service. The fact that ham gear transmits on those frequencies does not mean it is free for anyone to do so! If you are not a ham, you have no reason to be on those frequencies period!
And transmitters over 100 milliwatts require F.C.C. type acceptances. If anyone operates a transmitter on those frequencies, without a good reason and KNOWINGLY interferes with law enforcement - that is not to be taken lightly. The California Penal Code states that anyone who is interfering with a peace officer in his duties, it is "obstruction of justice", plain and simple.
And guess what people... Not being a ham operator in radar freqs is a good intent case that will stand in any court. Being a past volunteer for L.A.P.D. in the Van Nuys Area Hamwatch, I can say that it is best not to ignore my warning.

73 de William, N6RKY.

--- A second reply, but still misguided:

....And yes I have little or no patience with questions like those because of previous people that I had to deal with always tried to usurp the law with that logic like the above. However when cases like these get to court, the judge will aways side with the authorities unless civil rights or liberties have been violated. And that is extremely rare, if ever.
But remember this.... Unless you have a GROL with "Radar Endorsement" or an Amateur Radio license, you do not belong in the radar band. The power level of 100 milliwatt is the usual trap used by the FCC. But a lower power is also illegal when interference to public service exist between your device and public service.
Parts 13 and 15 of the FCC rules and regs cover those. CBers and many hackers get away with their bad deeds until this occurrs. BUT when it does occurr, it is usually the HAM Auxillary personnell that track it down. The police break in and confiscate the equipment and arrest you THEN the FCC will cite you with an "Notice-of-Appearent-Liability" as the final step.
There is no chance to repent of your misdeeds after that, since those who do these things "NOBODY FEELS SORRY FOR THEM". Yes, I had been on some cases like that. I have also been with civil ones also. It is on the civil ones where I get the most attention though. Public services usually don't

get as much attention since the press usually is not on the scene when it goes down.
What am I trying to say to you? If you are in front of a judge, and a lawyer asks you what reason you have for a radar transmitter.... That question alone will send you to jail no matter how you answer it. The fact that you have it, without a good reason is the intent to cause a problem to a public service agency.
And the worst part of it will be this.... Someone like me tracked you down, BUT you will never know it - until it's too late. That is why I am being direct like John stated. Because it is not a game, and it is becoming too common place in today's society.

73 de William, N6RKY.

--- Why do I think these posts are misguided?

From my poking around I have found out three conditions that limit the use of Highway Zappers. They are as follows:

1. They must be less than 100milliwatts of transmitting power or be licensed as a radio broadcasting station.

2. If they are over 100mw of power, the operator must also have a HAM license. There are test guides available at Radio Shack, and tests can be taken for low cost (maybe $10) with many HAM clubs.

3. They must not interfere with any other radar equipment, especially police Radar guns.

As long as you stay below 100 mw you should be safe from number one and two above. Most Highway Zappers are 10mw or so, but some home built units have been reported to transmit at up to 250mw! Check before you buy a kit to avoid any problems.

X-Band radar (which is what the zappers use) is 10.525 GigaHertz. The upper end of the HAM band reportedly stops at 10.500 GHz, 0.025GHz below the Zappers frequency. HAM operators can get in trouble for transmitting in this range.

I think the above protester had in mind other devices sold as radar scramblers and are intended to jam police radar and thus avoid tickets. These are completely different in form and function and should be inert to police traffic radar. You can check with your local police department to be completely sure. Heck, some police departments own them (or similar devices) and use them on highways to control traffic.

As for the interference with police radar, I posted that question on a law enforcement board and got this reply among others that generally said that they don't cause any problems with police radar, and if a cop saw one in use, they probably wouldn't have a problem with them because they help them more than anything, assuming that they knew what it was.
Here are some replys I got:

�Rich.... I did try that, just to see what would happen. I had one of the Zappers and another unit that was home-brewed and sold by a local resident. Using two of our MPH Industries K-55 units (X-band of course, and one at a time), I transmitted the Zapper and the other unit directly at the radar antenna from various distances. Nothing happened. No speed reading at all, even when the Zapper was 1 inch from the antenna. So, interfering with police radar with one of those types of units isn't a problem for anyone. I have HEARD (not seen) about some units that transmit a much more powerful signal in an attempt to foil traffic radar, but have only had REAL confirmation about one being effective. That was from the 2/95 issue of Corvette Fever, where they did a test of various Radar/laser detectors and other devices that claim to thwart traffic radar or laser. Only one worked, a $500 unit for X-band radar only. You'd have to be a very serious violator, and hope that you don't run into K or Ka band radar or laser. I don't know of anybody like that, hihi.�

�As a law enforcement officer and a ham, I will try to answer this for you. 1st, the "zappers" are legal... The fall under Part 13 that states that a device that transmits with a power rating less than 100 watts does not have to be licensed. The zappers definately fall into this category. 2nd, these radar zappers operate on a different band than the speed detection radar devices used today. I believe that the zapper works on the X band, and X band Radar guns a very rarely used anymore. Its a wonder why detector manufacturers still make detectors that will detect X band Radar. Most used today use K, or Ka.... and of course the new laser light....�

�I have had one of these for about a year. It is grand entertainment! It puts out 10mw @ 10.25 GHz. It falls through the FCC cracks as a "test/communication" device.�

� Kentucky Department of Transportation several years back installed small silver boxes with small windows on them that transmit a carrier signal on radar solely for the purpose to prevent the use of radar detectors on Interstate 75 coming into Cincinnati. They were installed on overpasses and telephone/utilitty poles about every half mile or so. This situation was made public a few years back and KDOT specifically stated the purpose and advised that in doing so was not in violation of any Federal Law. Of course this provoked a very heated debate with the public. Threats of vandalism were made and the last that was heard was any one caught damaging such devices will be prosecuted for willfullly damage or destruction of public property. After many years the motoring public finally accepted that the use of radar detectors in this 5 mile stretch of highway was limited to the "off position" until motorist cross the bridge into Cincinnati.�

--- Uses:

1. Obviously the single best use of these devices is to slow the guy that just blew past you doing 90mph.
2. You may also be interested in testing the radar detector you plan to purchase (or demonstrate if you are selling them).

3. Activate the unit and see what breaklights come on ahead of you, then reel em in.
4. If there are more than one radar equipped cars, see if you can keep them in a group or single lane as long as possible. As soon as someone pulls out to pass, hit the button again and watch them fall back into line.

---Final notes:

I haven't seen anything that limits these devices in regards to the law. If anything should pop up, please follow the law.
You can contact me to make corrections/additions to this list at: xrbarron@fullerton.edu for the next year or so.

1040. MOD FOR THE BEARCAT 200 XLT

Newsgroup: rec.radio.scanner

It is (or should be) standard procedure to teremite radio transmission in the vicinity of a suspected
explosive device. Whether or not the bomb was actually set off by cellular or not may not be known - It could
have been a garage door opener remote, etc., if it was radio at all. Generally you just want to stop
transmitting on all frequencies so you don't accidently set off anything.

Did it have any effect on rescue/investigation communications? I would imagine it did. They probably had to
resort to "runners" to send messages. That's what we do. It is not very efficient.. but it beats blowing up.

This bandwidth is used considerably in tracking down narrow-band Satellite SCPC audio carriers. Usually, by hooking up a scanner to a Satellite recievers 70 mhz output. and tuning to a Satellite transponder with known SCPC activity you're able to hear all sorts of audio activity. Mostly radio networks etc.

Have there been changes made? Any info app.

1046. Two Old Scanners For Sale

Newsgroup: rec.radio.scanner
Date: 1995-04-21 00:00:00 UTC
From: samwick@sol.cms.uncwil.edu
Message-ID: <3n7ft5$42u@sol.cms.uncwil.edu>
Source record: 258098

FOR SALE: 10-channel SBE Opti-Scan VHF/UHF scanner with unique optical-card programming system and permanent memory. Scan over 16,000 frequencies without crystals. Includes programming guide, reference manual and 15 reprogrammable cards. This unit has been factory altered to optimize reception on the amateur radio 'ham' frequencies. AC or DC. $45, includes shipping.

The factory frequency range for this scanner was 30-50, 150-170, 450-470 and 490-510. However, I had this unit factory 'tweaked' slightly off-band for 2-meter (143-150) ham reception, which then eliminated reception of other frequencies. I will include a 19-page photocopy of the factory alignment procedures, should the purchaser wish to have it adjusted back to original factory specs. Comes with an AC cord and a fused DC hook-up for mobile use. There is no mounting bracket, but the thumbscrews are still there. Scanner accepts a standard Motorola-type antenna plug. There is no built-in telescopic antenna on this model. Unit works, although I haven't used it myself in over 10 years.

FOR SALE: 10-channel REALISTIC PRO-52 VHF-Hi/Lo crystal scanner. Excellent condition. $25, includes shipping.

This is an eight-channel scanner. The frequency range is 30-50 and 148-174. 120VAC only. Comes with the following 8 crystals: 42.60, 42.66, 151.385, 154.13, 155.28, 155.34, 156.70 and 156.80. Standard motorola-type antenna recepticle at rear. Also came with a small telescopic antenna, but as of this writing, it is not with the scanner (I'm still looking).

>more info, send mail.

Wow!! Oh my.... This is the 2nd service I have seen offering cellular restoration for the AR8K. First, I saw it on AOL. The guy charges $50, which includes shipping back. Doesn't say how it will be shipped though.

For most scanner people here, they really don't care about someone programming in the freqs for their area (IMO). I have Percon's CD, but it doesn't tell me which frequencies are the most active and worth scanning.

Hell, I think I'll charge $12 (enough for a case of beer) and have the receiver pay for the shipping when he receives (whichever way he wants).. Like FedEx overnight-PM, which is pretty cheap. That would probably cost someone about $30.

Oh, another thing for those considering paying someone for this service....
If you pay around $50, why not just purchase the interface yourself and buy some software. Yes, right now there is the only one software (>$100) program that I'm aware of that will allow you to change the ROM information.
I would expect someone will probably make a stand-alone application that does this though and sell it for $5 or give it away..

Yes, I have a UK Interface for it as well as software program neccessary.

Source record: 258103

: jdweiss@iwaynet.net (JD Weiss)
Subject: Re: cordless and cellular telephones
Date: Wed, 19 Apr 1995 00:01:41 GMT

JD,

in message #18924 you babbled thusly:

" WHO CARES IF IT'S NOT LEGAL??? I sure don't! I listen as often as
I can and I don't care IF IT IS
against the law. Who is going to stop me and how are they going to
catch me?"

< snip >
and continued:

" I had an arguement with my wife about this. I had the scanner in
scan mode. She called (corded phone)
someone a few doors away (who was on a cordless) and heard herself on
my scanner. She came unglued
demanding what the H_ _ _ I was doing listning to her phone
conversation. I explained the cordless phones
are using a radio frequency that anyone with a scanner could hear and
that if she didn't want to be heard
to tell everyone not to use the cordless. She bitched about it for
about a week. My comments to her...
TOUGH SH _ T! She stilll uses the cordless phone, so I guess she
didn't learn anything. Typical of most.
JD"

Legal-schmegal... right-schmight. When you're dealing with your wife,
use your head! (the one on top). The
only way to get the last word in such an arguement is to say, "Yes,
Dear." You were out of line, buck-o.

I have a "friend" who has been known to accidentally pick up cordless
calls. He's smart enough to hit the lock
out button the moment he recognizes the voice of his beloved.

The good book says, "For what shall it profiteth a man if he should
gain the whole world and lose half of it
in a divorce settlement!" (OK, so I took some real license with that
one :-))

Yeah, tell them that when they hit you up for 71/65. "But sir! I wasn't
that far over. I was daydreaming. I was just keeping up with traffic!!"

"Thats nice sir. Sign here. Bail is set at $335. You court date is XXX.
Thank you, have a nice day. You're free to go."

That air trap was a revenue oriented activity---Plain and simple. When
they start nailing people for 70 and trucks over 60, I can't see that as
anything BUT revenue generation.

Source record: 258114

Hello.
I am selling these two wonderfull scanning radios.

1. Realistic PRO-57
2. Uniden Bearcat SC150B!

1. Realistic PRO-57-look in your current Radio Shaft catalog and find the PRO-508. It is basically the same radio. Or, look in last years catalog and look at the PRO-58.
It is base or mobile, covers 30-512mHz, backlit full frequency display, direct frequency entry keypad, antenna and external antenna input, very good condition. Just $75 firm.

2.Uniden Bearcat Sportcat 150B-get the scanner everyone is talking about! Speed, Speed, Speed-the fastest kid on the block. 800 mHz. 100 channels. It has it all folks! This handheld comes with nicads, charger, rubber duckie antenna, manual. I paid $200 for this radio just 2 months ago-my loss is your gain, make me an offer I cant refuse.

Leave mail for more info or to order!
Thank you.

1068. Optoelectronics Scout 40

Newsgroup: rec.radio.scanner
Date: 1995-04-21 00:00:00 UTC
From: clark.neider@iotp.com
Message-ID: <8A7D4B5.059E000BDC.uuout@iotp.com>
Source record: 258120

Has anyone seen the Optoelectronics Scout 40 sold for under $400.00? I thought I saw them going for $379.00 last year but didn't latch down on one. Now I see that Grove sells the Model 40 for $449.00. Last year's model was the Scout 25. I don't have an EEB catalog and don't see them listed in the Monitoring Times EEB ad.

I would like to find the best price on one.

... ICOM 7100: the semiautomatic assault scanner.

Even though the cell freqs are locked out you can still hear alot of
cell images... If that's what your after. Over all it is a pretty good
scanner. Shop around for the best price, I bet you get one for $179.00
new somewhere.

Good luck.

1072. PANASONIC KX-T3960 SECURE CORDLESS

Newsgroup: rec.radio.scanner
Date: 1995-04-21 00:00:00 UTC
From: pkh@mec.allied.com
Message-ID: <3n9a7f$e73@caess8.cae.aro.allied.com>
Source record: 258124

Does anyone know more about the PANASONIC KX-T3960?
Is it 900MHz or 46/49MHz? Is it digital or analog?
Does it use simple frequency inversion like Motorola's
Secure-Clear phones, or does it use a more complex method?

Frequency inversion can be unscrambled with a simple $50
descrambler. Digital phones with encryption (I've seen
only 900MHz phones like this) are almost impossible to
descramble. I've yet to see a 46/49MHz that used a
method more sophisticated than frequency inversion.

1073. Trident TR 4500 - anything better?

Newsgroup: rec.radio.scanner
Date: 1995-04-22 00:00:00 UTC
From: accroya@ix.netcom.com
Message-ID: <3n9pa0$rld@ixnews4.ix.netcom.com>
Source record: 257975

I've been looking to upgrade to a killer scanner. I saw an ad in Popular Electronics for the Trident TR 4500 (for $449). It has everything I can think of. Are there any suggestions for alternatives that may have more bang for the buck? What do I want? EVERYTHING! I'd like total coverage (to 1.3 gigahertz), WFM, lotsa channels, a priority bank, etc. I'm open to suggestions!

Thanks
James

1074. Where is the GOOD military stuff???

Newsgroup: rec.radio.scanner

I am a amateur radio operator (KC7FFX) and a freq. (no pun intended ;)) scanner. and I have seen in freq. charts where military is spread throughout the bands, but I have NEVER heard anything from them. I live near a minor base. I am curious what freq. I should listen to with my basic scanner (PRO-46) or other RX gear (possibly HF???)? I have heard about monitoring 220mhz to get some, but haven't found anything... I know they are there, but WHERE????

Any and all help would be GREATLY appreciated!

Just put mine up last night along with the grove pre-5 pre-amp. The
construction is good (not great) and the performance so far for me is
excellent.
I use both the grove sacnner beam and their Scantenna. The Scantenna also does
a very nice job.

For the price range of these units I think you will be happy. They both
definately blow away the RS discone I started with.

Frank.

Excuse me for trying to be helpful! If I had any more information I would have given it, sheesh, someone asks for some info and I give what I have and get this kind of blasting? Take a chill pill pal!

Talk about being biased you sound like a salesman for that product you mentioned, getting kickbacks or something? I never claimed to be a source of info, heck I gave the guy a phone number. If you are dissatisfied with the extent of my knowledge I guess you'll just have to get over it somehow.

>
>Is this accurate?

Yes and no. The US version IS the only version which is blocked. As per
the law, the scanner cannot be EASILY modifiable. I won't tell you
exactly how to do it, and it does take some knowledge as you are actually
modifying a part of the ROM. It is not as easy as connecting with a term
program and typing say "869-896=open". That would be too easy, hence a
violation
of the law.

I just caught one side of an interesting message.

Time: 1535 hrs. CST

Freq: 167.5625 (FBI Nationwide) CTCSS Tone=167.9

Content: Denver 500 (believed to be an Air Unit) was calling St. Louis. Asking St. Louis to contact HQ in Washington and advise them they would be landing in approx. 1.5 hours. They further requested that someone from the ID section be waiting on them as they were enroute with "major case prints". Also asked St. Louis to notify Aviation Special Projects Group of their plans and asked that a car be waiting for them. Denver 500 gave a 1-800 number for St. Louis to call. Interesting!

After moving from the fed frenzy of SanFrancisco to the midwest, I had all but given up on most of my fed freqs. They are usually silent. I guess an intercept like this makes it worth leaving them programmed in the radio. Did anyone else catch any of this traffic???

Oh yes, I am located in Terre Haute, IN.

Br> Jerry,
Br> Sorry about the name screw up. I hadn't seen posts from you in a
Br> while so I forgot. You shouldn't have to put the Re: in front of your
Br> replies, the software should do it for you. My point was that not
Br> everyones software or interface automatically puts the Re: when they
Br> reply. Out of curiosity, what
Br> do you use to reply to massages? I assume it is an offline reader
Br> since your
Br> messages seem to be grouped together so closely.

Hi, Brett...
Actually, the software (Bluewave 2.12) _will_ do it for me. I just
didn't know it could until I was troubleshooting another problem and saw
that there was an option to automatically put "Re:" in front for me.

I had ASSumed that the software did it for me, too. Somewhere I changed
the configuration, I guess.

I see your point on the Re: matter and did not take it as a flame, so no
concern there.

No sweat on the name screw up. There's only 100 + other people here,
so...:)

Take it easy...Jerry

Please be advised that most of these channels are operated in
conjunctions with a CAD Syatem, which is a Comuter Aided
Dispatch Unit. When a "brrrt" noise is heard over the air, that is
when a CAD transmition is being made. Such messages on a CAD
transmittion are:

CAD KEYS: MEANING:
10-7 SCN ----> On Scene (arrived at call)
10-8 SCN ----> To Scene (enroute to call)
10-7 DES ----> Destination (arrived recieving hospital)
10-8 DES ----> Destaination (enroute recieving hospital)
10-7 STA ----> Station (off the air, at Station)
10-8 STA ----> Station (on the air, returning to station)
RTT Request To Talk)
ISA In Service and Available)

Codes are also used by the BCAS, and they are as follows:

Code 1 Patient being accompanied to hospital with friend of relative
Code 2 Routine
Code 3 Emergency, respond using Emergency Traffic Equipment
Code 4 Dead On Arrival
Code 5 Police
Code 6 Fire Department/First Responders
Code 9 Infectious/Biohaxard Patient
Code X Ambulance Not Used
ANU Code X
CVA Cerebrovascular Accident (Stroke)

MI Myocardial Infraction (Heart Attack)
GI Gasrtointestinal
NYD Not Yet Diagnosed
MVA Motor Vehicle Accient
AOB Alcohol On Breath
VGH Victoria General Hospital
RJH Royal Jubilee Hospital
CDH Cowichan District Hospital
SPH Saanich Peninsula Hospital
ALS Advanced Life Support

LL> Can. > Every so often I hear them say "go to channel 5".

Probably the simplex channel for Windsor P.D.. Try 140.130 MHz or 411.6375 MHz. If that's not right, try 141.585 or 141.975 MHz, both common simplex channels in Ontario.

Regards!

Does anyone know if, or when the 1995 Grove CD-ROM is suppose to be out?
I bought the 1994 version that had some problems and Grove said they
would replace it with the 1995 version when it's out.

Hello Merlin:

I bought my OPTO back when they gave a free copy of Scanstar with it. It worked OK, as did the trial version of ScanCat.

Then I got Probe by Datafile. It scans at 55-60 channels a second and has a serviceable database built in. It will even run on a palmtop with 640 K and no hard disk. Probe is all I use - your mileage may vary.

The Military aviation band is 220-400MHz. Your PRo-46 does not have this
coverage I'm araid. You may find some activity on the VHF frequencies
allocated to your local base but unlikley.

What base are you near ?

If you do have a UHF (220-400) capapble scanner the art of finding
active discret frequencies such as Air-Air's, Air Refuelling, Operations
and others is to use the search fac8ility but just search small
segmants. Spend a hour or so just seraching 5 or 10MHz rather than the
whole 220-400 spectrum.

The TR-4500 is I beleive the same radio as the AR2500 which was/is
unfortunately not the worlds greatest radio.

I am sure there must be some happy owners out there but most seem to
have more negative comments than positive. There have been some recent
threads in this newsgroup re the same radio.

The AR2515 on which this is based was considerably better as it used the
AR2002 "receiver" with a go faster CPU. It wasn't perfect but far more
"useable" than the current variant.

Sort of. The pro43 should be capable of about 40 ch/sec or so with the replacement of CX1 next to the CPU. You can try a 6Mhz or an 8Mhz microprocessor crystal as a replacement and ck. the results. Parts?: Digi-Key # CTX026 (6Mhz) or CTX056 (8Mhz.). Good luck.

Yes, Netscape is a browser. When Netscape sees a valid URL in
a message, it processes it as though you entered it yourself in the Open window.

URL = Universal Resource Locator - they include http, ftp, gopher, etc.

I haven't been following the thread, but cutting of cellular service
is not a viable deterrent to bombing. Cellular is here to stay, and the
corporations that are making megabucks from it aren't going to just shut it
off in case there might be some goofball who wants to use it for some illegal
activity.

After all, a large portion of cellular traffic in big cities is crime
related already. Do you think Cellular One really cares?

Besides, governmental agencies are far too reliant on c-phones to
conduct routine and emergency operations. If cellular service were terminated
in an affected area, they might have to learn how to rely on less convenient
technology. That isn't likely either.

<rheaume@humnet.westonia.com> wrote:

>Tower will give them takeoff permission. Tower will give them their next
>frequency, which will be departure control.

Actually, the departure frequency is almost always given as part of
the instruction obtained from Clearance Delivery. So the
typical instruction from the tower, given just after takeoff, would
be something like:

"Global 123, contact departure."

Kind of leaves the poor scanner listener out in the cold. However,
you can usually find departure frequencies in the Airport/Facility
Directory, Sectional Charts, or Terminal Area Charts.

>Departure control will get them up to or close to their cruising
>altitude and direct them to the proper "airway" or route toward their
>destination. Departure will assign them their next frequency which will
>be an enroute terminal service. "Toronto Center" or "Cleveland Center".
>This continues toward the destination.

This is correct. The phraseology is like this:

"Global 123, contact Denver center one-two-five point niner."

If you want to find out more about listening to aviation frequencies,
go to your local airport and find a general aviation FBO. You can buy
the Sectional, TAC, and A/FD for your area for a grand total of about
$17.00. Sometimes FBOs will give expired charts away. These charts
are quite self-explanitory.

Have fun

Ne> I, personally, was also worried about the regulation - does the
Ne> battery pack have some kind of regulation, or do I need to put a 12v
Ne> regultor inline in the cord. I am interested in hooking my scanner to
Ne> a car electrical system, and know how unstable the voltage can be on
Ne> these. Does the Uniden cord include a regulator?

The battery pack on the 2500/3000 does have a small circuit board for
regulation. As long as you don't exceed 12 VDC, you should have no
problem. 13.8 v from the car shouldn't be a problem, but I usually drop
down to 9 volts on my car adapter, just in case...it will still work fine.

Cool in IL, for now. Last year, there was an attempted passing of a law
that would have made it illegal to possess a scanner that was capable of DC
operation. Thankfully, that was averted.

1118. Re: Grove scanner beam?

Newsgroup: rec.radio.scanner
Date: 1995-04-22 00:00:00 UTC
From: daichelm@news.enet.net
Message-ID: <3nc6dl$f4n@pinyon.enet.net>
Source record: 258067

: >Does anyone have a Grove scanner beam? Looks interesting. Is it worth $60?

I have a Scanner Beam which works fairly well IF you can get it up in the air away from surrounding metal etc. It is NOT particularly well made, but ok for environments with light to moderate wind. It has 19 elements and here is a list of center frequencies for them:

# of Elements Center Frequency
2 977 mhz
2 886 mhz
1 810 mhz
1 746 mhz
1 659 mhz
1 603 mhz
1 578 mhz
1 525 mhz
1 457 mhz
1 411 mhz
1 318 mhz
1 258 mhz
1 204 mhz
1 113 mhz
1 86 mhz
1 73 mhz
1 58 mhz

As you can probably tell from the list, it doesn't favor the low band (30 - 50 mhz) and has gaps in the 155 mhz Police Band and above the cellular band. At ground level the RS loaded whip and the Diamond discone work better on the low band and Police band than the Scanner Beam. I have an ANLI dual band collapsing whip antenna for ham use (1/2 wave whip) which works VERY well at the 155 mhz and 460 mhz frequencies, better than the Diamond and the Scanner Beam unless you get it in the air. Frankly, if I was going to put up a high in the air permanent scanner antenna and money wasn't an issue ($400) I would pick the "Create CLP5130-1" antenna and probably stack 2 of them for additional gain.

IA>Don't let anyone tell you that business users are not alowd to use GMRS.

IA> I run a licensed GMR repeater here in Cincinnati and funding for the tower
IA>space (at $260 a month) is done primarily by my LICENSED business users.
IA> Most all business users of GMRS realize the advantages of where they are
IA>at and don't dare let their licenses expire. Of course it is true no more
IA>business licenses aren't issued anymore BUT those that are grandfathered
IA>can and will still be legal to continue use of GMR.
IA> If it wasnt for these clients I would be forced into relicensing the
IA>repeater on a nother radio service. Family and occasional users just
IA>don't generate the revenue for maintaining most "big gun repeaters".

IA> Of course my business customers aren't channel hogs ...Everyone gets
IA>along with each other very well.

IA>So just to keep the story straight....I hope "newbies to GMR" don't try
IA>to come aboard overnight, hear a business user AND try some bullshit
IA>"Hey get off of there, cause you ain't legal" type of stunt because
IA>in the long run you might be cutting your own throats (unless you can
IA>cough up prime tower rent and system maitenance fees)

IA>Here in Cincy, business and personal users of GMR can and do work together.

well, things are much different out here in northern california. the
gmrs band is packed with users and there are business users out here who
ARE channel hogs. the gmrs community at large in my area would like to
see them off the air, but because of the grandfather clause, they remain
in the band, taking up space with the high-level repeaters they use.
ALL the channels are taken out here, with several repeaters per channel.
there is NO room for anyone else on the overcrowded systems out here,
and people are getting fed up enough to pull down antenna towers and
clip coax. i'm not involved in that game, but it's coming to that quite
rapidly.

Yes, we all know it's a violation of federal law--however, last time I checked, we the people make the laws
and we can chage, modify or ignore them if they are unreasonable. Prior to the passage of this law the
radio frequencies belonged to everyone to listen to. Perhaps it would be better to put the burden where it
belonged--on the users of cellular communications then the scanner listerners.

1126. Re: Opto Scout or R10 Interceptor - info wanted

Newsgroup: rec.radio.scanner
Date: 1995-04-23 00:00:00 UTC
From: Dick Dillman <ddillman@igc.apc.org>
Message-ID: <APC&1'0'7cbf1eac'ecd@igc.apc.org>
Source record: 257875

Greetings:

I've got both the Scout and Interceptor and yes, it's cool to have both. I'm in the happy position of using them both professionally so I had a good excuse for buying and fiddling with them.

The Interceptor came first, with 800MHz band pass filter. Even with the filter the Interceptor is almost useless in a city. It has so many things to lock on from pagers to FM stations that its little brain just about shorts out. However, in a rural area, it can be just what's needed depending on your need. In my case the target was a trunked system with the mobile units of interest within about 1/2 mile of my location. As you know, trunked systems are tough to monitor and, even though I was listening to the base signals the Interceptor gave me only the transmissions of the nearby units - which is what I wanted. Worked well and even tipped me off to exactly the information I needed. However, it took a year before the target of opportunity arose in which the Interceptor paid for itself. As to the 800MHz filter, I never ended up using it.

The Scout has just been added to the bag of tricks. As far as I can see so far it works as advertised. The little stubby antenna is a nother matter. It seems deaf at anything below 450MHz. My advice is to not buy the antenna even though it's cute and use a standard scanner rubber duck instead. The vibration option is good when you're taking an innocent public tour of the target facility and don't want your back pack to beep every time the escort uses his HT. I had it in my shirt pocket for the first test, forgot about it, and almost beeped myself the first time it went off. I've not yet had the opportunity to use it in an actual job but the quality and performance so far appear to be impressive.

Happy listening...

Regards,

Dick Dillman

Isn't what they're doing illegal? One part of the federal
privacy act states that information obtained on the scanner must not
be relayed to anyone not a party to the transmission (in this case, the
whole world). I always wonder that when I hear some TV reporter blabbing
about what's on the scanner.

You should be able to tell by watching TV. The firefighters, medics, and special rescue teams are competent enough that they are walking several blocks to see that the people get the word on what they do and why.

The police, including the federal type, are hiding behind whatever secrecy they can impose, afraid the people will find out what they do.

So the first groups wants listeners and the second doesn't.

1141. Know 800Mhz+ low power freq?

Newsgroup: rec.radio.scanner
Date: 1995-04-23 00:00:00 UTC
From: patriot@kaiwan009.kaiwan.com
Message-ID: <3ndp3i$ond@kaiwan009.kaiwan.com>
Source record: 257989
Cross-posted to: rec.radio.amateur.homebrew,alt.radio.scanner,rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.policy,rec.radio.scanner

I need to know a frequency that can be used for a low power transmitter for "home" use, like a remote control or whatever, above 800 Mhz. I want to put out up to 300 mW, but would settle for 100 mW.

I really don't know where to look, so if you would please tell me where you got your data, it would be appreciated. I looked through my "scanner" listing and also the ARRL manual with no luck.

This is for use both in the USA and elsewhere, so it would be nice to have a freq that is open everywhere. (yea I know, good luck)

It needs to be "approved" by any local government, since it may become a product.

Please write me via Email, so as to not tie up the net, thanks!

patriot@kaiwan.com

From: bodoh@dakota.net
Message-ID: <3ndj1c$kk3@westie.mid.net>
Source record: 257993

Hello,

I am a ham radio operator (N0YGT) and a longtime scanner enthusiast. I am thinking of supplementing my scanner accessories with either an Opto Scout 40 or an Opto interceptor 10. The Scout would be a good tool for finding new frequencies, but the interceptor would be good for use in public areas where I would not want to be to obvious fiddling with a frequency counter and scanner. Any comments on either of these devices from owners?

BTW - wouldn't it be slick to have a combination of the two, or perhaps Opto would consider a scanner/counter/interceptor combination....

BS> Can anyone tell me where I can find a programming cable for a
BS> Motorola 550 "flip-phone"?? The cable plugs into the data port of
BS> the phone and the parallel port of a PC computer.

Are you sure that that is what it is used for? From what I understand, the dataport on the flip phone is used so that you can connect it to a modem, preferably a cell modem, and then the data port on the modem is connected to a PC.

At least that is what I've recently found out in my quest for a cellular modem hookup.

From: derek@shore.net
Message-ID: <3ndj7o$997@northshore.shore.net>
Source record: 257995

Speaking of low batteries, I just picked up a set of Hi Capacity NiCads from RS. Being ignorant to the electrical end of things, does anyone know if I can use the stock charger that came with my Pro-43 or do I need to buy a separate charger for the HiCap Nicads?

The batteries are rated at 0.85 mA and suggest 14 hours to charge two of them. The back of a package suggests which RS charger to buy but it doesn't list the specs of the charger in the catalog.

Any info would be appreciated.

Thanks,

Derek

According to the manual that came with my Pro 43, you should use a 9 volt
300 mA AC adapter (Cat. No. 20-188).
18 hours at 9V is what the book says you should do. You sre right, the
"someone" is wrong.

Lewis

In _my_ area alone.... there are at least 5 different sets of codes.
In my copy of Police Call, there are about 30 sets of codes, all different...
Then you get variations of codes. Some agencies make 'em up as they go.

>

The O.J. case has clearly shown that re-broadcasting information
heard with a scanner is ignored by law enforcers. Even here in

the UK, the former bank manager who claims he heard Princess Diana was never prosecuted (to the best of my knowledge). I even saw him listening to cell band frequencies with his Icom R-7000 on TV - still no prosecution.

If we are going to have laws against these activitives, they should be enforced. If there is no offence, then why have a law in the first place.

The situation is very similar and far from ideal on both sides of the atlantic.

The by-frequency section in the back lists about 13 pages of 800 MHz frequencies, mostly designated as trunked channels. Whether this constitutes "keeping up," I couldn't say. If I understand correctly, _Police Call_ checks the FCC license database for its listings, so these frequencies should appear in the book as soon as they're available--which is often long before the services actually get around to using them.

Anyway, if there are a couple of specific communities you're interested in, I could check them for you.

Yeah I'm interested, BUT only IF you've corrected all the mistakes in it. The last version I saw was a bigger pile then Haruteq's last attempt.

You know, if you go through it and delete all the duplicate and/or outdated information you would not only have a more reliable piece of resource material, but you'd also only have to print about 2/3 the number of pages there by making more money, and those of us "in the know" about your material would also stop making fun of it.

In the meantime I guess I'll just stick to getting information the old fashioned way, word of mouth.

I just picked up an early model PRO-43 at RShack (modifiable, but not modified) two weeks ago. I paid $249.00 plus tax (they are closing them out at this price, as you probably know).

I'm interested in moving up to an AR8000 and would like to sell this. There are no problems with it, in fact it kicks butt over my older PRO-37. (I just want one of the big boys). I can return it to the Shack and get my money back, or if you want to pick it up for the same cost, let me know.

Nicads will not charge unless the charging voltage is higher than the
battery temrinal voltage. Six nicads in series supply 7.2V, more or less.
So a 6V charger won't cut it.

Someone in Canada asked after the non-800 number for Tandy National Parts; it's 817/870-5600, and I can testify that they don't blink at shipping to Canada.

Intertan Canada (the Canadian distributors of Radio Shack products) appear to have a similar department called Intertan Technical Services; their number is 800/661-2390. I haven't needed anything from them since I discovered their existence. Has anyone else tried them?

What type of scrambling is being used? I suspect it must be something
other than speech inversion as that's not "secure" at all. I have a
friend who uses his speech inversion descrambler on those neighbors
who are foolish enough to believe their communications are "secure."

Of course he's only using it to determine the source of interference
with his reception of the golf channel. ;-)

: Speaking of low batteries, I just picked up a set of Hi Capacity NiCads
: from RS. Being ignorant to the electrical end of things, does anyone
: know if I can use the stock charger that came with my Pro-43 or do I
: need to buy a separate charger for the HiCap Nicads?

: The batteries are rated at 0.85 mA and suggest 14 hours to charge two of
: them. The back of a package suggests which RS charger to buy but it
: doesn't list the specs of the charger in the catalog.

The high capacity is current capacity. The voltage is the same, so the
same charger will work, just take a little longer.

From: blakjak@csulb.edu
Message-ID: <3nftms$34j@garuda.csulb.edu>
Source record: 257892

Requesting mods to scanners to receive CW transmissions.
I understand this may require tapping into a point in the
receiver circuit to get an RF level at the tuned frequency.
This voltage could be fed through a comparator and used
to trigger a tone generator.

As far as tuning goes, would I tune to a frequency higher
than the one I wanted to listen to with a double or triple
conversion receiver?

Thanks in advance.

: >
: > Actually, I don't know who to believe at this point.

: For what it's worth, I use an electric razor with Nicads, and after a few
: months of daily usage (recharging continuously) it would diminish motor speed.
: After disposing of several razors with this same failure mode, I decided
: after reading the KH6B article that I would run the razor to nearly dead
: state, then recharge it for 24 hours. After doing this, the razor has
: essentially the same motor speed as it was new. Dean's article saved me $$.

: 73 Dave WB0GAZ dgf@netcom.com

Nicad batterys should always be charged fully prior to there use but
not overcharged.Failure to fully charge the battery prior to use will
cause the memory effect especialy if this often happens.Also
Nicads should be discharged to their minimum useable level (approxamately
1 v per cell) about once per month under normall usage conditions <a little
past the low battery warning>if you treat these batterys whith this type
of care they will typically last about 10 years, if you have purchased
high quality batterys.A good charger will have an itelligent charge circuit
that fast charges the batterys to exactly the right point and then tapers
the charge to a tiny tricle and will give you an indication of compleation
(typically a led indicator)at this point the batterys should be removed from
the charger.
The memory effect is caused by for instance charging the battery 2/3 of
the way
then using it, then charging again only 2/3 of the way if this occurs often
enough (2-5 times) after a while the battery will charge only 2/3 of its
original capacity at that point the battery is damaged. If the battery is
again only charged partialy the memory effect is worsened and the total charge
capicity is further reduced, eventialy the battery becomes useless.
Some of this comes from personal expierence (particulary from having seen
others ruin them) and from taking good care of them myself and from reading
the GE nicad battery book.A good fast charger and a good set or 2 of them
is well worth the money.If you can't afford a fast charger and you need to
use your radio on the go often a 2nd set is a must.
If you take care of them nicads will last almost a life time.
A good charger and a couple sets of high quality nicads may set you back $100
or more but it is sure cheaper than chucking them in the trash periodicaly

and pouluting the environment.

Check a recent issue of ShortWave Magazine (UK) as it cannot be sold in
the US.

I forgot to mention (yes, Jeff) that I wrote a long review of the DJ-X1 a
while back. If there is interest I can dig it out. Suffice it to say that
it's only marginally better than the IC-R1 and the user interface is a LOT
weirder.

The 220 will receive images, but very little intermod, while the 2500 has very few images, but has more intermod (I personally find the images more acceptable). The 2500 has a hit counter, 20 banks of 20 instead of 10 banks like the 220. The 220 has 10 search lockouts which is not a lot, but it is a whole lot better than none. The 220 has service search. I find since I got the 220 that I don't use 2500 a whole lot.

Call Grove and get a catalog for more details on the differences.

1199. Ottawa-Carleton Police Frequencies

Newsgroup: rec.radio.scanner
Date: 1995-04-24 00:00:00 UTC
From: lgl@achilles.net
Message-ID: <lgl-2404952222470001@dialup92.achilles.net>
Source record: 257912
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anybody know what is going to happen (or what has happened) to the scanner frequencies for the new amalgamated police forces in the Ottawa-Carleton region?

Any info would be greatly appreciated!

Thanks.

Sorry, I missed the original article so the attribs are probably messed
up.

I went thru 2 battery packs (inserts really) on my BC200XLT by
chrging/running the radio off of 13.8+/- VDC from the lighter socket. The
radio is designed for 12 VDC, not the 13-15 that the socket spews. Do
like the last guy says and get a real adapter and drop it to 12 or 9 ...

Speaking of BC3000XLTs, what's the best street price for one? Bob Parnass
gave it a good review in MT and I'm tempted (pending permission from the
comptroller, of course :).

Over the weekend I monitored "Rescue Command" on one of the OKC Fire Department Freq. It was very active and VERY organized.

I just wanted to say one thing about the response by my fellow Oklahoman's. I a very proud of all of the fire fighters, police, EMTs, medical trauma team members, media and volunteers that answered the call for help during the initial hours of this emergency. Oklahoman's redefined courage through out that day. May God bless each and every one of them!

Hi. I just got into scanning with a purchase of a Bearcat 700A Super Scanner. I was wondering if anyone is in Iowa that can give me a little info on some good freqs for my area. So far, I'm having a great time listening to the police and cell phones but would love to find out what else is out there worth listening to.
The scanner I bought has the hook-ups for my car so I was also wondering if it is legal to have a scanner in your car in Iowa.

Thanks in advance,
Tom

Not always - I was working at my Junior College when (then vice-pres) Bush was visiting. The Secret Service guys kicked us out of our office so they could do a search with the dogs. We all sat in the lounge with a small scanner and heard them combing the campus in their initial security sweep....

(I didn't want to try to bring it to the actual rally - (a) I had to work the lights and needed to listen to the stage manager and (b) I was afraid the Secret Service might feel anxious about a guy (other than them) walking around with an earphone sticking out of their shirt.)

Actually they have a guy (or guys or gal) in Gettysburg that reads the mandatory public notices that are posted everyday. This has been quicker than waiting for tapes in the past. Recently, the FCC started making the daily amateur license files available via ftp, so this may all change in the future.

Ol' Gene will have to concentrate more on "value added" than just (almost) raw data ...

Uh, actually, you can speed. Yesterday I did a rural average speed of 63.

OSP (and McMinnville Police) were so gracious to post thier speed traps in the clear open, so that you could see their cars at least a good 3/4s mile away. Enough time to let your car slow to 54. And laugh.

(Oh, I forgot to say, NO, I wasn't on I-5, or I-84, or even I-205.)

The last list for the area that I have is about three years old and it
shows about 30 channels in the 470.000 range that are allocated to
LAPD, but not in use. Can you trunk at 470.000?

The KXT3960, 3965, 3970 all use some sort of inversion. They are 46/49 MHz analog phones. Not all inversion techniques are the same so the $50 descrambler may or may not do the trick. I've got the 3970 and figure I'm safe from casual listeners.

>
>--
>
As far as I know, the ni-cd battery should always be charged with the higher voltage than the battery. eg. 6 batteries nicd has 7.2 V so it should be charged with the adaptor producing greater than 7.2 V otherwise you would be charging the adaptor instead. The current does not play a significant role (not sure though) in charging. Less current, more charging time. However, there is a max limit of current that a AA cell can handle. Best bet, get a radio shack 9V adaptor which is specifically designed for the scanner and I think it produces about 500 mA that I use for my PRO-39.

I've got an AR8000.

kiley@cs.utd.edu.uk (Kiley) writes:
: Well, is it thumbs up or down???
:
: I have been waiting to either buy the 8000 or the Yupi... Just can't decide.
:
: I was leaning toward the 8000, but then I start to hear horror stories about a
: keypad gone bad, loose knobs... what's the deal?????

Keypad is fine, but I hear stories of the printing wearing off the
white keys if you use it a LOT. When I first got my unit I entered
about 350 channels right off the bat, manually, using the keypad.
Keypad is still fine. Then, I got the snug fit case which has clear
plastic over the keys. Actually easier to hit the buttons now,
and, are now protected against ANY wear (and keeps the LCD from getting
scratched).

Loose knobs, yes. The gray rubber knobs are a little wiggly.
They slip onto the shafts of the controls, thus there is no set
screw. I used a narrow strip of electrical tape wrapped around
each of the 3 metal shafts to make them a little fatter. Push
the knobs on, and they are nice and tight. No problem. Whether
you use the tape trick or not, they still will not fall off.

Mike

I guess I wouldn't really have a problem with someone offering a service of programming freqs, or changing bandplans, etc. (I doubt anyone would pay for that anyway!) But, I think it's really obnoxious to title the post **AR8000 CELLULAR RESTORATION**.....Come on.

Hmm, interesting. I usually keep it down around there. The cops seem to
love that "instant on". Not that you can go that fast anyway, theres
usually fifteen billion RV's clogging up the Highway doing 5 under, thank
god for the occasional passing lane.

I have no clue whats gotten into the OSP, but they have been
hitting I-5 from Albany to Eugene with a lot of units. they seem to be
focused on MP 220 near Halsey. Now the question I have is why? From
Albany to Eugene is a straight shot. Heck, you could fall asleep and make
it the whole way. I guess they figure theres plenty of folks to tax so why
not? I'm used to the occasional 1 or 2 units on I-5. Well, write enough
$500 tickets and you can afford more units. Their also focusing on HWY 20
from I-5 to Corvallis, all of those college kids coming into Corvallis
make a nice target. Between I-5 and Corvallis you will find at least one
trooper.

I just bought the BCT7 Beartracker 800. It worked great for my trip from
South Florida to TN.

Its preprogramed for state police freqs and has a warning light if a State
troper /w repeater in trunk is close

It also monitors CB ch.

Traveling with that and a cheap radar detector saved me from 8 tickits !!!

$200

Ohh how I agree with you. The problem is, is that most people are fed
info by the insurance industry. To them 65 is like the sound barrier,
anything over 65 is dangerous territory, why, your car could suddenly
tumble out of control and spew death all over the roads of America. Fact
is, every one drives where they feel comfortable. For me 85 on a freeway
is comfortable. Now, do I drive 80 in a school zone? No. Theres a fear
that people that drive over 65 are killers---nonsense. The same people
who yell at me for doing 80 and "endangering" their kids, are the same

people who drive their minivans full of kids with no seatbelts, bobing all over the car, and making faces at cars in the rear window. But, hey! I'm reckless.

Of note, I'm pretty sure the NMSL for trucks is 55. The cops were really taking it to truckers.

It really depends. If they use voice inversion, you might be able to.
If you here a click-click-click-click throughout the transmission with
data at the beginning of the transmission and a daffy duck type sound,
then forget it. As far as I know, Motorola made a voice-inversion
scrambler that changes inversion frequencies on every click. As for DES,
you wouldn't know it anyways. It sounds like really low-volume squelch
and is virtually impossible to descramble.

Anybody know the freq(s) for NYPC helocopters? I often see them buzzing around my neighborhood, looking around w/searchlites -- I'd love to know what they're looking for.

While I'm at it ... I often hear "go to 10." I've been listening to 478.7375 and 470.7375 (both of which I've see listed as "ch. 10") but haven't heard much. So ... what really is "ch. 10" and how far can a mobile transmit?

Thanks!

>
> Shore stations are 4.600 MHz above the ship frequency. In
> U.S. waters the shore frequency may be used on Chs 20, 24-28 &
> 84-87. Chs 1-5 & 60-64 are shared with other services. Chs 75
> & 76 are reserved as guard bands for ch 16.
> Specific assignments include:
> 06 156.300 Intership Safety
> 15 156.750 Weather, notices, etc
> 16 156.800 General Calling
> 22 157.100 Coast Guard Liaison

Channel 13 is the required bridge-to-bridge frequency used by
ships navigating in close proximity to each other.

Channel 16 is designated a calling *and* distress frequency. Everyone
monitors this one; calls to other ships or shore stations are kept
short, and once contact is established the two stations will quickly
move to a working channel. Combining a calling _and_ distress frequency
together is an excellent idea, for then you know where to find someone,
yet if you have an emergency everyone within range will hear you since
they're sitting on that channel.

Those of you living near the ocean or a large body of water should
place Channel 16 on your scanner's priority memory. The Coast Guard
and other maritime authorities appreciate as many ears as possible
monitoring this frequency. We in the Coast Guard radio service don't
just monitor one or two radio frequencies, but many dozens from many
remote receiver sites. For example, here in Hawaii I would be monitoring
Ch 16 Maui repeater
Ch 16 Oahu repeater
Ch 16 Big Island repeater
Ch 16 Kauai repeater
Ch 23 Maui
Ch 23 Oahu
Ch 23 Big Island
Ch 23 Kauai
2182 kHz Oahu
2182 kHz Big Island
8364 kHz Oahu
plus the high seas SSB ship-to-shore frequencies in the
4, 6, 8, 12, and 16 MHz bands
plus CG aircraft frequencies and aircraft distress frequencies
plus others which I can't recall now (too many years!)

With all that noise it's easy to miss a weak `mayday'.

In fact, if you're scanner also covers the aircraft band you can help the FAA out by monitoring 121.5 MHz, too. Oh, don't forget 2182 kHz, 5680 kHz, CB channel 9, 500 kHz (if your code speed is at least 20 wpm), 8364 kHz, and any other distress freqs I might have missed.

Jeffrey (ex U.S. Coast Guardsman)

Gee, IMHO the lawmakers in your state are completely missing the point. What I find very dangerous on U.S. roads in general, and especially on interstates, is the fact that trucks drive at about the same speed as cars. I often had a truck pass me when I was already going at 5-10 mph above the speed-limit. This is really dangerous, since accidents involving trucks will alway pose a major threat to smaller vehicles. In every European country I have been to trucks have to obey a limit that is at least 10 mph below that of other vehicles.
In Germany you will very seldom see a truck passing you on the autobahn for many reasons. First of all you will usually drive at speeds above 80 mph anyway and only an empty truck with lots of hp's would be able to pass you at that speed. Second traffic will usually allow the truck driver to maintain constant speeds of 60-65 mph anyway, so he simply won't need to pass anyone.
The only chance for you to run into a truck would be to crash into him from behind. Actually that happens sometimes (mainly due to truck drivers not seeing you when passing lanes) but is far less dangerous than having a truck engage you from behind. IMO your speed limits should be raised (on selected roads that is) to at least 75 mph. Better make it 80 mph, allowing trucks do drive at a maximum of 60. Those limits could then very well be enforced in a reasonable way, especially keeping in mind that the biggest concern should be to protect the safety of smaller vehicles. Anyway, the fines you describe probably do very little to make people drive responsibly, all they will be good for is to make people vote someone else at the next elections.

From: bbraun@assi.s-link.de
Message-ID: <5kTPY5AHnXB@p-bbraun.assi.s-link.de>
Source record: 257947

Hello,

I've bought a portable scanner which looks like a OEM product. The
german dealer is ALBRECHT Elektronik and the scanner is named AE200.
It has 1000 memory entries in 10 banks, the frequency range is from
0.5 to 1300 MHz. Modes are AM, FM and WFM. In the bottom row of the
keyboard there are two bigger keys named SEARCH and SCAN. The light
key is located at the upper right side of the keyboard, a protected
key-lock key is located at the bottom right.
Could anybody identify this model and tell me the original manufacturer
and the original model number?

Ciao...Bert

I tried to look this up. I would say not legally. Only because the FCC doesn't seem to say that you can. In the 800 and 900 bands that specifically authorize it to be licensed. I didn't look trhough the books real hard so I might be all wet here.

Technically - yes you could. But since effective trunking technologies are full duplex operations I don't think it would be a desirable band to work with. The 800 and 900 bands have enough spectrum to allow 45 MHz tx/rx splits. The 5 MHz splits you normally see in the 450 - 470 range would likely make the mobile equipment (particularly hand held two ways) too big or too expensive.

Disclaimer: I am just commenting - do not assume I know what I am talking about.

Source record: 257830

Excuse me if this has been covered before, but I have a question on the
AT&T model 9100. I bought this phone about two weeks ago and as soon
as I got it out of the box, I tried to get it on my scanner with no luck.
I scanned only the range of the handset which is 925.07 to 927.75 Mhz.

Does it not seem likely that I would have gotten something, even if it were
only for a second or two.

Thank for any reply

JP

1246. Northern N.Y. State Police

I'm looking for any frequencies used by the N.Y. State Police. I
live about 50 miles north of the U.S. / Canada border, but I think I would
be able to drag 'em in with my discone, as I pick up O.P.P. calls from
farther away than that. Any help would be appreciated (E-Mail welcome).

Thanks.............

Just an interesting followup to that...the April '95 issue of Monitoring Times has a Canadian Retailer advertising in it. The magazine placed the following disclaimer above the ad:

"...<Retailer> assures us (Monitoring Times) it will give a full refund and hold customers harmless from shipping expenses if a purchased unit is returned to the vendor by U.S. Customs."

You could discuss this subject forever - but I suspect that if the drug dog is happy with the package it sails right on thru...whats next - 800mhz sniffing dogs...:)

1251. So the AR8000 is the best? But no cell 800?

Newsgroup: rec.radio.scanner
Date: 1995-04-25 00:00:00 UTC
From: accroya@ix.netcom.com
Message-ID: <3nhncv$hfv@ixnews3.ix.netcom.com>
Source record: 257836

I've been convinced that the AR8000 is perhaps the best scanner. These are cell-blocked, though, aren't they (and all other scanners with 800)? Now - isn't the 8000 a handheld? I've never owned one - and I always thought the non-handheld were supposed to be better. I realize that sounds horribly uninformed, but I've never really paid attention to such things until now - now that I want the ULTIMATE SCANNER!

Any comments or advice are appreciated.

Thanks,
JW

PS - Can someone tell me why I keep hearing what sounds like regular telephone signals in the 450-485 range? I can't find any listings of such freqs....

The RDS (RBDS) Standards are available through the Electronics Industry Association and the National Association of Broadcasters. RDS is very common in Europe where it is used to identify stations which change frequency as you travel through different countries. US broadcasters us it to display call signs and program content but so far it hasn't really caught on with the radio manufacturers. RDS is also used in this country by CUE Paging for interstate paging and by DCI for differential GPS correction. If you want more info drop me some e-mail at Dave_Asada@TerrapinCorp.com.

>comptroller, of course :).

I used to charge my 200xlt and still charge my 2500xlt straight from the
lighter socket without any problems, but it may be an issue of what kind or
car you have. Maybe I got lucky and the 3 different cars I used had regulated
power at the lighter plug. I have never had a problem with my batteries.
Checking your lighter plug voltage with a meter should tell you if you need to
add a regulator or not.

I heard EEB has the best price on the 3000XLT: $369

My experience has been that prior to the Pres. or VP landing, the SS
will talk a lot in the clear, and as soon as the Pres. arrives they switch
most everything to DES scrambling. Then, once the Pres is gone, they switch
back to non-scrambled mode.
It is best to monitor the state, county, and city agencies when the president
is there, since they talk in the clear, and usually provide lots of
interesting details. In California, there are some CHP frequencies in the
155MHz range that seem to gets used a lot.

>more details here in netland.

This is probably some enterprising person who has Scan*Star and the interface
for the AR-8000. I think there are probably people out there with a US
verison of the 8000 that would like cellular restored, without buying the
software and interface. I have no experience with "MEGA-BYTE" so I can not
even say if they are legitamate, but I think a more honest advertising pitch
might create less suspicion.

Never mind buying any incorrect and out of date frequency directory
for Southern Ontario. Get it all free here on the internet.

The following is a complete and up to date list of what I use and
have confermed in southern ontario for the emergency services.

If you have any additions or corrections please Email me.

I also have on computer Maps of the Metro toronto area showing
police patrol areas fire department hall locations and ambulance
station location. Areas include Vaughan, Markham, Richmond Hill,
Brampton, Mississauga, Caledon, Scarborugh, North York, Toronto,
Etobicoke and more.

Newsgroup: rec.radio.scanner
Date: 1995-04-25 00:00:00 UTC
From: Ron Katz <ronkatz@interlog.com>
Message-ID: <3nj7l8$q46@steel.interlog.com>
Source record: 257847

Please if you have any additions or corrections ,...email me and
I will update my records. I am also interested in a better list
for Aircraft and Railroad with better descriptions of how or what
the channel is used for.

Ron Katz
News Videographer

: : keypad gone bad, loose knobs... what's the deal?????

: What kind of horror stories ?

I know what you mean, I am listening to my AOR8k as I write this and what
he means is that the writing on the keypad comes off VERY easy (mine wore in
1 week and i was VERY carefull with it) unless you buy a leather pouch
for it, which totally stops the wear.

As for loose knobs on it, i think i know what you mean, but its nothing to
be worried about at all.. The knobs on the top have a slight bit of play
in them as you turn them but its not much...

Certainly wouldnt distract me from the unit.. there are other things that
i dont like but thats prob only me.. :)... go for it..

Catch ya,

I was just wondering what the press does about digital scrambling by the police. Do some agencies provide a radio or descrambler to the press, or must the press begin relying solely on police sources and press releases when a city begins scrambling? What about major emergencies when the press like to be on the scene?

If I were a police reporter, I would feel that I needed to have some way to verify what the police were telling me . . . some way to hold them accountable to the public.

And, one more thing, do you ever think that we will see a day when technology defeats technology? In other words, when descramblers become so fast at figuring out the "keys" used in digital that digital scrambling will be as worthless as speech inversion?

No Keypad activated mods.
There is a cellular mod floating around. Involves relocating a couple
of surface mount resistors.
The scanner looks nice and I like the VFO control but found it a little
shy on sensitivity and selectivity. Also didn't like the fact that the
step size in the 220 Mhz ham band was internally programmed wrong and
could not be manually altered. I ditched mine and went back to the
PRO-2004.

Oh yes !! I want to spend $49 just do be able to drive around and
watch people hit their brakes and possibly cause an accident when in
fact my intent is to reduce the number of speeders.
That makes good common sense ! (NOT) :(

Sounds like the same mentality of those who get off racing to the scene
of an incident or accident that they've heard on their scanner.

>in that range?

SWR meters need a transmission source, usually a fairly high
power one for accurate results. So that's not what you want.
If you want the best match between your antenna and coax,
a Rx noise bridge is the tool you want, or an antenna analyzer,
which is really a low power RF source combined with a sensitive
impedance bridge.

>Also, I read somewhere that SWR is not important if you are
>only receiving a signal. Is this true or is it hogwash?

When you are transmitting, the transmitter is the source,
and the antenna is the load. When you are receiving, the
antenna is the source, and the receiver is the load. So
what you really want to match to minimize SWR on the line
is the coax to the receiver. Since that's normally already
done, SWR from a mismatched load is a moot point.

Signal loss due to SWR is an I^2R loss, IE the series resistance
of the line dissipates excess signal power as a function of the
current flowing through it. Since received signal currents are
tiny, and receivers generally have excess gain anyway, SWR in a
receiving system is usually not critical. You will obtain maximum
signal transfer when you tune the source to match the impedance
presented by the coax, but unless things are grossly out of whack,
the practical effect of a mismatch is small.

Gary

Hi

Please forgive the newbie question.

I have a scanner and would like to tune my homegrown antenna/coax
to minimize SWR in the 139MHz to 143MHz frequency range.

Assuming I rush out and buy an SWR meter that functions in
the given range, how do I determine SWR without a transmitter
in that range?

Also, I read somewhere that SWR is not important if you are
only receiving a signal. Is this true or is it hogwash?

1274. ?? Digital Encryption ??

Dave, I use a Ramsey SS70 Descrambler between my scanner and an external speaker to descramble. Here's a previous post of mine:

Subject: Ramsey SS-70 Descrambler

The address of Ramsey Electronics is 793 Canning Parkway, Victor, New York 14564. Phone 716-924-4560. Credit card orders at 1-800-446-2295.

Unless you are fairly adept electronically, I would suggest ordering the SS-70WT....the WT just means "wired & tested". The SS-70 kit is $40; the case kit is $15; the fully assembled kit and case is $80.

You'll also need to go to Radio Shack, etc. and get some "cables" and adapters. For my PRO-2037 with external speaker set-up, I needed a 1/8" RCA phone plug to 1/8" RCA phono plug cable ~$4, and a 1/8"phone plug to 1/8" phono plug RCA adapter for the external speaker ~$1.

The set-up works great and it descrambles all sort of common speech inversion, "duck-talk" and otherwise unintelligible speech transmission. It will not descramble digital/high-tech scrambling.

Good Luck

There has been much discussion on the Highway Zapper issue as of late. To catch everybody up on what has been discussed I am compiling a list of some of the highlights of this discussion from the past month or so from various sources on and off the net.

--- What is a Highway Zapper?

A Highway Zapper, also known more loosely as a radar activator, is a small garage-door-opener-type of device that, when the button is pressed, sets off radar detectors that some drivers use to attempt to avoid tickets. Naturally, if the other driver thinks that they may be going too fast, will slow down to "normal" speeds. They are generally available for about $50 and run off a 9v battery. There has been some questions about legality of using these devices as well, but it looks good if reasonable power limits are used. There are also some alternative things to think about using for those that want to home-brew their own radar activator.

This is the point where most everybody has an opinion, and the discussion falls into a flame war about speeders. We aren't going to do that - it's been done to death. The basic points to these arguments are 1) speeding is bad 2) stopping people from speeding is bad.

--- Contact Info on Highway Zappers:

$49.95

--- Other possible sources for those that like to do a little digging:

There was once a magazine construction article which described how to make a small 10.525 GHz transmitter with a strip antenna, which would set off X-band radar detectors within a half-mile or so. Since then a couple of

companies have offered kits (preassembled or build [AND **TUNE**] yourself versions). Cruise through electronics and ham magazines for ads from Innotek, Electronic Rainbow ("The Zapper") and JDR Microdevices (a computer parts outfit who are reselling a lot of the Rainbow kits).

--- Other related ideas:

The City of Menlo Park, CA has acquired a bunch of handheld police radar units which it will loan out for a week at a time to private citizens living on streets with speeding problems. The individuals using the radars can write down the license numbers of particularly egregious speeders and the police will send out letters notifying them they've been observed speeding in a residential district and asking them to slow down in the future. I guess there's nothing better to set off a radar detector than a real radar transmitter. For someone who lives on a winding two-lane road having numerous residences, lots of children in them, 17,000 cars/day going past, a 35 mph posted speed limit, an 85th percentile around 48 mph, and absolutely no enforcement, this thread has generated lots of useful ideas.

Most x- Band 10 Ghz microwave transmitters work real nice.Check nuts and bolts and you will see some discount 10Ghz microwave for video.

I have a couple of surplus dual-tech (PIR/microwave) motion sensors that I'd like to use to "test" radar detectors with :-). By powering them with the specified 12VDC, walking around the room, and watching the indicator lights they both seem to function. The horns are self-contained cast metal assemblies having a cavity with an electrical part (Gunn plexor diode?) stretched across them. One terminal protrudes through the casing and is connected to wire having a positive voltage. There are small screw adjustments, I assume to be used a fine tuners, that are glued in place and intact. Both seem to have a pot used for microwave sensitivity adjustment.
My questions:
1. Although both microwave emitters are marked 10.525 GHZ, they don't register on a working radar detector at any distance at any setting of the pot mentioned above. Why?
2. How do I get the intact unit to trigger a radar detector?
3. What parts do I remove, and how do I wire them, to use the horn assembly separately?

I&#65533;ve heard of people getting surplus motion detectors from supermarket sliding doors and hooking them up to do the same thing. They operate at 10.525 GHz - the same as X-Band radar, and are usually 12vdc to boot.

--- An interesting, but misguided reply I got regarding the Highway Zappers:

&#65533;Any transmitter over 100 milli-watts outside of citizen's bands is by F.C.C. rules illegal unless licensed. And anytime interference with a police radio/equipment is experienced - the offender is risking whats the usual charge from interfering with law enforcement.... Obstruction of justice.... N6RKY

P.S. You might want to review the F.C.C. rules part 13 for that....
FROM THE GENERAL RADIO TELEPHONE OPERATOR LICENSE MANUAL by W5YI with WB6NOA which is available at Radio Shack....
Pg 12
These listings only describe when radio OPERATOR licenses are necessary. Before you operate any radio station, make certain that the station is licensed as required. CB and Radio Control radio stations do not require individual station licenses.
The holder of a commercial radio operator license or permit is not authorized to operate amateur radio stations. Only a person holding an amateur radio operator license may operate an amateur radio station.
WHAT DOES THIS MEAN????
Most radar frequencies are shared with the amateur radio service. The fact that ham gear transmits on those frequencies does not mean it is free for anyone to do so! If you are not a ham, you have no reason to be on those frequencies period!
And transmitters over 100 milliwatts require F.C.C. type acceptances. If anyone operates a transmitter on those frequencies, without a good reason and KNOWINGLY interferes with law enforcement - that is not to be taken lightly. The California Penal Code states that anyone who is interfering with a peace officer in his duties, it is "obstruction of justice", plain and simple.
And guess what people... Not being a ham operator in radar freqs is a good intent case that will stand in any court. Being a past volunteer for L.A.P.D. in the Van Nuys Area Hamwatch, I can say that it is best not to ignore my warning.

73 de William, N6RKY.

--- A second reply, but still misguided:

....And yes I have little or no patience with questions like those because of previous people that I had to deal with always tried to usurp the law with that logic like the above. However when cases like these get to court, the judge will always side with the authorities unless civil rights or liberties have been violated. And that is extremely rare, if ever.
But remember this.... Unless you have a GROL with "Radar Endorsement" or an Amateur Radio license, you do not belong in the radar band. The power level of 100 milliwatt is the usual trap used by the FCC. But a lower power is also illegal when interference to public service exist between your device and public service.
Parts 13 and 15 of the FCC rules and regs cover those. CBers and many hackers get away with their bad deeds until this occurs. BUT when it does occur, it is usually the HAM Auxiliary personnel that track it down. The police break in and confiscate the equipment and arrest you THEN the FCC will cite you with an "Notice-of-Appearent-Liability" as the final step.
There is no chance to repent of your misdeeds after that, since those who do these things "NOBODY FEELS SORRY FOR THEM". Yes, I had been on some cases like that. I have also been with civil ones also. It is on the civil

ones where I get the most attention though. Public services usually don't get as much attention since the press usually is not on the scene when it goes down.
What am I trying to say to you? If you are in front of a judge, and a lawyer asks you what reason you have for a radar transmitter.... That question alone will send you to jail no matter how you answer it. The fact that you have it, without a good reason is the intent to cause a problem to a public service agency.
And the worst part of it will be this.... Someone like me tracked you down, BUT you will never know it - until it's too late. That is why I am being direct like John stated. Because it is not a game, and it is becoming too common place in today's society.

73 de William, N6RKY.&#65533;

--- Why do I think these posts are misguided?

From my poking around I have found out three conditions that limit the use of Highway Zappers. They are as follows:

1. They must be less than 100milliwatts of transmitting power or be licensed as a radio broadcasting station.

2. If they are over 100mw of power, the operator must also have a HAM license. There are test guides available at Radio Shack, and tests can be taken for low cost (maybe $10) with many HAM clubs.

3. They must not interfere with any other radar equipment, especially police Radar guns.

As long as you stay below 100 mw you should be safe from number one and two above. Most Highway Zappers are 10mw or so, but some home built units have been reported to transmit at up to 250mw! Check before you buy a kit to avoid any problems.

X-Band radar (which is what the zappers use) is 10.525 Gigahertz. The upper end of the HAM band reportedly stops at 10.500 GHz, 0.025GHz below the Zappers frequency. HAM operators can get in trouble for transmitting in this range.

I think the above protester had in mind other devices sold as radar scramblers and are intended to jam police radar and thus avoid tickets. These are completely different in form and function and should be inert to police traffic radar. You can check with your local police department to be completely sure. Heck, some police departments own them (or similar devices) and use them on highways to control traffic.

As for the interference with police radar, I posted that question on a law enforcement board and got this reply among others that generally said that they don&#65533;t cause any problems with police radar, and if a cop saw one in use, they probably wouldn&#65533;t have a problem with them because they help them more than anything, assuming that they knew what it was.
Here are some replies I got:

�Rich.... I did try that, just to see what would happen. I had one of the Zappers and another unit that was home-brewed and sold by a local resident. Using two of our MPH Industries K-55 units (X-band of course, and one at a time), I transmitted the Zapper and the other unit directly at the radar antenna from various distances. Nothing happened. No speed reading at all, even when the Zapper was 1 inch from the antenna. So, interfering with police radar with one of those types of units isn't a problem for anyone. I have HEARD (not seen) about some units that transmit a much more powerful signal in an attempt to foil traffic radar, but have only had REAL confirmation about one being effective. That was from the 2/95 issue of Corvette Fever, where they did a test of various Radar/laser detectors and other devices that claim to thwart traffic radar or laser. Only one worked, a $500 unit for X-band radar only. You'd have to be a very serious violator, and hope that you don't run into K or Ka band radar or laser. I don't know of anybody like that, hihi.�

�As a law enforcement officer and a ham, I will try to answer this for you. 1st, the "zappers" are legal... The fall under Part 13 that states that a device that transmits with a power rating less than 100 watts does not have to be licensed. The zappers definitely fall into this category.
2nd, these radar zappers operate on a different band than the speed detection radar devices used today. I believe that the zapper works on the X band, and X band Radar guns a very rarely used anymore. Its a wonder why detector manufacturers still make detectors that will detect X band Radar. Most used today use K, or Ka.... and of course the new laser light....�

� Kentucky Department of Transportation several years back installed small silver boxes with small windows on them that transmit a carrier signal on radar solely for the purpose to prevent the use of radar detectors on Interstate 75 coming into Cincinnati. They were installed on overpasses and telephone/utility poles about every half mile or so. This situation was made public a few years back and KDOT specifically stated the purpose and advised that in doing so was not in violation of any Federal Law. Of course this provoked a very heated debate with the public. Threats of vandalism were made and the last that was heard was any one caught damaging such devices will be prosecuted for willfully damage or destruction of public property. After many years the motoring public finally accepted that the use of radar detectors in this 5 mile stretch of highway was limited to the "off position" until motorist cross the bridge into Cincinnati.�

--- Uses:

1. Obviously the single best use of these devices is to slow the guy that just blew past you doing 90mph.
2. You may also be interested in testing the radar detector you plan to purchase (or demonstrate if you are selling them).
3. Activate the unit and see what break lights come on ahead of you, then reel �em in.
4. If there are more than one radar equipped cars, see if you can keep

them in a group or single lane as long as possible. As soon as someone pulls out to pass, hit the button again and watch them fall back into line.

---Final notes:

I haven't seen anything that limits these devices in regards to the law. If anything should pop up, please follow the law.
You can contact me to make corrections/additions to this list at: xrbarron@fullerton.edu for the next year or so.

Here we go again. :-/ The $800 to $900 is in Canadian funds, not US
dollars. The cell capable scanner can be had for about $600 in some
places. Now, how much are you charging for this "service" and lets see
more details here in netland.

Yeah, I'm sure it takes all of 10 seconds to sample the signal
into a PC with a Sound Blaster, do a spectrum inversion and replay the
contents.
All civillian "secure" phones do is encourage people to put at
risk secrets that they would not have done had they known how crap the
security was.

: cya l8er... -=lArRy=-

You must be having a laugh ! If the NSA has authorised such phones for unclassified (read civillian) usage then this tells you that they can break them in significantly less than real time. This means that Joe Student can go to his local university computer room and do an exhaustive key search in minutes.

Genuinley SECURE public phones do not exist, they are deemed a risk to national security because of terrorists and drug dealers.

Anybody who buys one of these things is in for a shock if they labour under the misapprehension that they provide some semblance of security.

Anyway thats my $0.02 worth,
John Wigley

1289. Improved Reception for Pro-43

Newsgroup: rec.radio.scanner
Date: 1995-04-25 00:00:00 UTC
From: c-luna@cc.memphis.edu
Message-ID: <1995Apr25.010329.46523@msuvx2.memphis.edu>
Source record: 257970

I seem to be having a problem with the reception of my Pro-43 while it is in a mobile setting. The problem is not in the form of noise but rather a loss of signal. This problem increases with the speed of the vehicle(not certain but doesn't seem to be RPM related.) The unit had a properly done Cell mod from day one. Any help would be appreciated as my Valentine 1 need a mate. :)

Thanx,

Craig

I heard on CNN on the day the bomb exploded that the reason the Feds
didn't want people to use their cellulars was because much of the public
safety and emergency freqs are in the 800 MHZ bandwidth and too much
cellular activity can hamper a trunking systems ability to find a clear
channel in time.

>would be greatly appreciated.
>

I had a Pro 34. It can be modified for 800Mhz, but the one I had was not
as sensitive as other similar radios and did not stop on as many
frequencies as did my Uniden 200XLT or my AOR900. Any new scanner you
buy will not be modifiable (unless you find an old one still on the shelf
somewhere). Probably with a good antenna your 34 will do fine for you.

Does anybody knows a good book for scanner frequencies besides the police calls I just recently got the book BEYOND POLICE CALL so far that didn't help at all i don't know what's up with the frequencies that they list it absolutely doesn't seem to be what they list when i pick up these freq's. I've been trying to pick up my schools freq its listed in the book as 464.5750. Its suppose to be the Hunter College's freq but i do not think that that's what i'm listening to. I'm picking up info on different addresses all over manhattan, it seems to be some small company's freq. And i've been trying to pick up another school listed there at 464.0000 and it also seems to be a messenger or delivery freq. i don't think that book is very updated. I need to know if anywhere in Manhattan do they sell the books that i need for the correct freq's. The POLICE CALL book seems to be ok they only have police, fire and other local freq's.

Most of the length is in the coil, if you are using a whip with a loading
coil. You could cut away most of the whip and still not receive 100-200
good.

Hello.
I have these three scanners for sale:
1. Realistic PRO-57
2. Uniden Bearcat Sportcat SC150B
3. Realistic PRO-43

1. Realistic PRO-57-same as current PRO-508 or last years PRO-58,
base/mobile, full frequency display, full direct entry keypad,
covers 30-512mHz, nice condition, Just $75 FIRM.

2. Uniden Bearcat Sportcat 150B, very fast handheld, 100 channels
, 800mHz, nicads, charger, manual, direct entry keypad, full freq
uency display, two months old, paid $200, contact me for current
price information.

3. Realistic PRO-43 super-handheld, full 800mHz with cell, 200cha
nnels, HyperScan, full frequency display, direct entry keypad, ru
bber duckie antenna, with manual and original box, was $349 at th
e Shack, contact me for current pricing information.

Let me know if you want any or all of these fine monitor receiver
s.
Thank you.

Useless disclaimer! From what I understand, U.S. Customs is not
in the habit of returning confiscated merchandise (to the vendor or
anyone else).

Which is the bigger risk? Buying from out-of-country, and risking
the possiblity of confiscation, or buying a used one from someone in
the U.S. (who already did the smuggling), and not knowing whom you're
dealing with?

The $815 that Atlantic Radio quoted me was in ** US DOLLARS **. The Canadian price was $999 Canadian dollars, plus PST and VAT, a total of $1150 Canadian dollars. Not wanting to be ripped off so bad, I bought mine at ComSec for $589, plus one of those cheapo EDCO interfaces for $99. I already had ScanStar Commercial to modify it for full coverage, so......

BTW, I offered to restore full coverage here on the Net for $75 about 2 months ago. 11 people took me up on it, and I'll bet they were very surprised when what they actually got charged was only the $15 for FedEx return shipping. It was a good way to filter out the whiners.....

I have exactly the setup you describe. My discone out on the balcony
works better than a 1/2 wave whip. The SWR is high (transmitting) when
I suspend it directly from the roof so I hung mine about two feet lower
and it is fine now.

1310. Need 200-300 Mhz Military UHF

Newsgroup: rec.radio.scanner
Date: 1995-04-26 00:00:00 UTC
From: FVJY50A@prodigy.com
Message-ID: <3nmb37$2j9a@usenetp1.news.prodigy.com>
Source record: 257791

I am looking for a portable scanner capable of receiving the 200-300 Mhz military UHF band. As far as I know, the AR-1000 and PRO-43 are the only handhelds capable of this, but I am not very current an my knowledge. If Uniden makes one with this capability at a reasonable price, I would be very interested, since I have gotten many years of good service out of my BC-100 XLT. Thanks in advance.

>radio is designed for 12 VDC, not the 13-15 that the socket spews. Do
>like the last guy says and get a real adapter and drop it to 12 or 9 ...

I very much doubt if the car 13.8 VDC killed the battery pack. The
packs use a voltage regulator and need an overvoltage. The schematic
for the 200 explicitly lists 13.8 as the nomiminal input voltage.

Being in a hot car is much more likely (if you did leave it in w/ the
windows closed). That kind of temperature is very hard on batteries.

Note that droping the voltage down to 9V is NOT a good idea. This is
less than the 10V is desired on the _output_ side of the voltage
regulator.

I've never heard of anyone's radio being confiscated upon import. I
have heard of many, many satisfied folks who have bought these radios
from outside the country. I had no trouble receiving my radio. So far,
the paranoia seems unfounded.

> /* barry /&

That's not the point. The 2004/5/6 are triple conversion. The first i.f.
is around 600 MHz and fairly wide. It's there because that's the most
useless place to listen. Since signals into the i.f. in this range interfere
with others you would be trying to hear, this range is blocked out in the
front-end. Doesn't stop signals from getting directly into the i.f. thru
the poorly shielded box, though.

: Derek

I think the previously mentioned 14 hours should be OK, since it is a
trickle charger, it usually can't over charge. If you are able to measure
the voltage of the cells after a charging period and cooling off period
and the voltage is back up to around 1.2-1.3 then I'd say it's fine. I
usually just plug in the charger and forget it. By the time I want to go
portable, it has been 24 hours. I just leave it on the charger when not
in use and actually while in use at the location of the wall charger.

I just bought a shiny new R-7100. The list of commands that can be used to drive the radio via computer is *very* short. Is the command list in the level converter manual all that there is?

Perhaps someone who is a guru of programming these receivers knows of more commands that aren't in the book.

I will be writing drivers in Visual Basic. If anyone has subroutines that they would like to share I am interested in receiving them.

1339. RadioMap(TM) *shows* transmitter sites near you

Newsgroup: rec.radio.scanner
Date: 1995-04-26 00:00:00 UTC
From: parnass@radioman.ih.att.com
Message-ID: <D7MEqM.IzG@ssbunews.ih.att.com>
Source record: 257865
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.swap

Where are the transmitters in your neighborhood? Around
your office? Let me *show* you --

From the rec.radio.scanner FAQ article:

Over 15% of the FCC licenses, including many fast food
restaurants, contain transmitter latitude and longitude but
specify no transmitter city. To determine the location of
those transmitters requires using the latitude and
longitude information.

As I have already done for dozens of radio enthusiasts and
companies across the country, I will locate FCC licensed
and selected FAA transmitter sites in an area of your
choice, and produce a custom report. To make it easy to
locate transmitters, the report includes an 8-1/2" by 11" |
scaled color map, protected by plastic and marked with |
transmitter sites, cities, highways, airports, military |
installations, national parks, etc. I call this innovation
RadioMap(TM) service.

It allows you to identify antenna sites and visualize the *
transmitter locations in your neighborhood, near your
office, at an airport, and other places of interest -- from
VLF through microwave. RadioMap includes police, fire,
local government, TV, business, industry, common carrier,
railroad, trucking, and many more types of transmitter
sites. In addition, wireline and nonwireline cellular
phone and AM/FM broadcast transmitter sites are clearly
marked using unique color icons. |

Industrial customers use RadioMap reports to survey the |
"radio environment" prior to installation of radios and
wireless microphones at customer sites. RadioMap is also |
used to find sources intermod interference problems. |
RadioMap has been very favorably reviewed in RCMA Scanner |
Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and
proprietary. RadioMap is completely different from the |
mapping on the Grove Enterprises CDROM and the current |
RadioMap does not use a commercial mapping program. Unlike |
"more tame" maps, RadioMap shows the locations of military |
bases, ammunition plants, arsenals, weapons factories, and |
other military installations.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states for $20.95 plus $5.00 shipping and handling. | Send $25.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

RadioMap has been favorably reviewed:

"... one of the most interesting reference products I've seen... ... an excellent reference tool." - RCMA Scanner Journal

"... truly an innovative product." - USSN

"...a Must Have!" - American Scannergram

Notes:

1) RadioMap is a trademark of Robert Parnass.

2) I cannot respond to electronic mail inquiries about RadioMap, so please call me some evening at telephone number above if you have questions.

Bob Parnass

1340. Repair Tips for Bearcat Scanner Radios

Newsgroup: rec.radio.scanner

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra of Cumberland, Indiana. In the mid 1980s, Uniden
bought out the Bearcat scanner line and Uniden's first
Bearcat scanner was the 800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s. Electra stamped all of its scanners with a
manufacturing date code on the rear of the cabinet. The
code is comprised of a single character (C = Cumberland,
Indiana, P = Puerto Rico), followed by four digits denoting
year and week the radio was built. For example, "P8422"
denotes the radio was made in the Puerto Rico factory
during the 22nd week of 1984.

Schematics and Parts Available

Schematic diagrams may be obtained from Uniden/Bearcat's
parts department, (317)842-2483.

G & G Communications (telephone 716-768-8151) is a family
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands. They are located at 9247 Glenwood Drive,
LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois |
(telephone 708-455-5105) has been repairing Bearcat
scanners for several years. They charge a flat $45 repair
rate for programmable and $30 for crystal scanners, and
shipping is extra. Electronic Repair Centers will fix

Regency scanners if they can obtain the parts.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 scanners I've fixed, C98, a | capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The

22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power | supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate | pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two

BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics | in two Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, armored cars, trains, taxis,
airplanes, and buses are all equipped with radios and you
can listen to them. You can monitor the local sheriff and
fire departments to hear about events "as they happen,"
before the news reporters hear about them. Hostage dramas,
bank robberies, car crashes, chemical spills, tornado
sightings are all fair game. In a single afternoon, you
can hear a high speed police chase, Drug Enforcement agents
on a sting operation, and undercover FBI agents as they
stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners | Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000

have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g.,

hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 is a good performer. All three models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a spring shaped antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to lightning strikes because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner

modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed

for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no | military listings and many pages are devoted to appendices | and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It may disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about

$100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than | PerCon's Spectrum CDROM. The licensee name and licensee | city are used instead of the DBA (doing business as) name | and transmitter city which makes query results confusing.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" | scaled color map, protected by plastic and marked with | transmitter sites, cities, highways, airports, military | installations, national parks, etc. I call this innovation RadioMap(TM) service.

It allows you to identify antenna sites and visualize the * transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. RadioMap includes police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites. In addition, wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons. |

Industrial customers use RadioMap reports to survey the | "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also | used to find sources intermod interference problems. | RadioMap has been very favorably reviewed in RCMA Scanner | Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. RadioMap is completely different from the | mapping on the Grove Enterprises CDROM and the current | RadioMap does not use a commercial mapping program. Unlike | "more tame" maps, RadioMap shows the locations of military | bases, ammunition plants, arsenals, weapons factories, and | other military installations.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states for $20.95 plus $5.00 shipping and handling. | Send $25.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, most at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15
June 17
August 19
October 14
December 16

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from
Police Call, which gives a more sterile, but uniform

treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no | military listings and many pages are devoted to appendices | and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than | PerCon's Spectrum CDROM. The licensee name and licensee | city are used instead of the DBA (doing business as) name | and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your

choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" | scaled color map, protected by plastic and marked with | transmitter sites, cities, highways, military | installations, airports, national parks, etc. I call this innovation RadioMap(TM) service.

It allows you to identify antenna sites and visualize the * transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. RadioMap includes police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites. In addition, wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons. |

Industrial customers use RadioMap reports to survey the | "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also | used to find sources intermod interference problems. | RadioMap has been very favorably reviewed in RCMA Scanner | Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. RadioMap is completely different from the | mapping on the Grove Enterprises CDROM and the current | RadioMap version does not use a commercial mapping program. | Unlike "more tame" maps, RadioMap shows the locations of | military bases, ammunition plants, arsenals, weapons | factories, and other military installations.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states for $20.95 plus $5.00 shipping and handling. | Send $25.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A

recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base"

while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a

convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

From: mike@dino.eng.monash.edu.au
Message-ID: <3nl2rg$j7d@harbinger.cc.monash.edu.au>
Source record: 257869

Does anyone have the address of AOR in Japan?

I tried to get it out of Access Communications Australia only to be told that they don't give out that information. This was very helpful seeing as they could not answer my question and were of no help to me at all.

They seem to know nothing about the AOR 1000 XLT other than how to repair it and thats that. If you want to know something about a component used in the scanner (such as the cpu, or a documented cpu data line) they cant/wont help, so I thought going to the makers may be more fruitful.

Yes, you have discovered that CT is now starting to use their Statewide
State police trunk radio system! Low band is still in use, however they
are starting to use the Trunk in some areas. I don't have the freqs on
hand with me, but they are available in Police Call or any FCC database
disk that is sold today. Other regional Scanner Guides will have them
as well.

Happy Listening...

Bill

The same thing happened a little over a year ago with the Turnpike. One day without warning the freq went silent. The original plan was to move everyone to the trunked system. Maybe they've finally worked the kinks out.

Oh well. Trunking stinks...

1353. RS PRO-51 keyboard codes

Newsgroup: rec.radio.scanner
Date: 1995-04-27 00:00:00 UTC
From: Mike.Coletta@commctr.com
Message-ID: <623_9504271049@commctr.com>
Source record: 257729

I have a PRO-51 with a date code of 7A4. This seems to be the last date coded model that can take the keyboard mod as I have tried it on later models with no success.

Try this: First try hold LOCK-OUT, 2 and 9 keys down while turning on power. Test frequencies should be loaded into the first 25 channels. If channel 23 contains a magic frequency then you can direct search and store using the monitor function to and chan.
If that does not work them as on my model I held BAND, 2 and 9 down and then turned on scanner. Before the display scrolled with the test segment pattern to the far right I held down the LOCK-OUT, 2 and 9 keys. This then loaded the test frequencies and channel 23 contained the magic frequency. I could them direct search, and store the active frequencies into the banks I wished. WARNING: This method does zero out any frequency you have programmed in prior to the method but since you only have to use this method once (being that you have stored at least one magic frequency for futher use) it will not need to be used again. Hopoe this was not too confusing. This aslo gives you the 30 KHz steps you need. Happy scanning.

1354. RS RG-8 vs other RG-8?

Newsgroup: rec.radio.scanner
Date: 1995-04-27 00:00:00 UTC
From: brett_miller@ccm.ut.intel.com
Message-ID: <brett_miller.243.000C5BE0@ccm.ut.intel.com>
Source record: 257730

Radio Shack sells their RG-8 for about $0.22 per foot while another local shop (Antennas West) sells it for about $0.47 per foot. Does anyone know if the Radio Shack coax is of lesser quality than normal? Specifically, is there more loss in their RG-8 than others? I currently use some RS RG-8 on one of my antenna drops and have not had any problems, but the antenna is a Diamond Super Voice that has a built in preamp, so loss is not really an issue.

I know I can get some flexible 9913 for about $0.58 /foot, but I dont really want to pay the shipping or wait for delivery.

Comments?

>What's the BEST glass mount antenna for car use? focusing on pub service bands?
>Also what mobile scanner is best at keeping out noise?

as far as the antenna goes, I just tied into the existing am/fm stock antenna. it seems to work Great for me, I can get a county 35*40 miles away. radio shack sells a splitter for the ant. lead & a short coax. w/ 2male ends so you can use the radio and the scanner at the same time with good results.
Any mobile scanner should work good, if noise is a proplem get resistor spark plugs or, if needed ,a filter.

I would like to hear other comments about sharing the am/fm antenna from others good luck |-))))))))))

Here are some bits of files I've picked up over the years:

From: Carl Clawson, N7KBV
The interface is bi-directional, using TTL levels on asingle line for sending and receiving serial ASCII data.You may need an appropriate hardware interface to convert,for example, RS232 to TTL.

The interface uses a "carrier-sense, multiple-access with collision detection" local area network protocol, so that multiple rigs can be connected in parallel without difficulty. Thus, you can use the same RS232 line and level-converter interface to control many rigs. Each rig must have a unique address, which is set by internal jumpers. Each model comes factory preset to its own address, which is 04 for the 735 and 08 for the R7000.

The rigs send and receive data in variable length packets, which are formatted as follows:

Byte # Contents

1 hex 'FE' (i.e. 11111110 binary, 254 decimal)
2 hex 'FE'
3 <RX>
4 <TX>
5 <Code>
6-n <BCD data of variable length>
n+1 hex 'FD'

The two hexadecimal FE bytes signal the beginning of a packet, and the FD byte signals the end. <Code> is the control code sent by the computer to the rig, which determines the action that the rig will take. In some cases, the

receiving rig will include a control code in its response to the sender; see the section "Control Codes and Responses" below. <TX> is the address of the device sending the data, and <RX> is the address to which the data is being sent. When a rig responds to a data packet, it addresses that response to the <TX> in the packet. Thus, if your computer requests a rig to report its frequency, it will address that report to the computer and other rigs will ignore the data. (Of course, the computer can lie about its address and trick one rig into talking to another!) Your computer should use its own unique, non-zero address on the network. I will assume in the examples that the computer is at address 02. There are two control codes that can cause any rig on the network to respond when sent with <RX>=0; I discuss these below.

Bytes #6 through #n contain any data required by the control code, in BCD format with 2 decimal digits per byte. Frequency data is sent starting with the byte containing the 1-Hz and 10-Hz digits. These digits are sent even if they are not used by the rig, so that the data format is the same for all rigs regardless of their frequency coverage and resolution. For example, consider the frequency 25.13244 MHz. This is broken up into two-digit groups:

25 13 24 40

It is then coded in BCD. In other words, consider each digit group to be a hexadecimal number instead of decimal. The decimal values of these BCD digit groups are 2x16+5=37, 1x16+3=19, 2x16+4=36, and 4x16+0=64. Now send these groups, starting with the least significant. The complete data packet will be, in hexadecimal,

FE FE <RX> <TX> <Code> 40 24 13 25 FD

If you have more than one rig on the network you may occasionally receive a sequence of 5 bytes of hex 'FC'. This is the "jammer code" used by a rig to indicate that a collision has occurred. Each rig, when sending, monitors the interface. If it does not receive exactly what it sent, then a collision occurred, i.e., another rig was sending data at the same time. If a rig detects a collision when sending a packet, it will wait until the network is idle, then send the jammer code. A rig that receives this code will realize that a collision has occurred and ignore the previously received packet. Because the ICOM remote control ports are bi-directional, your computer will receive everything it sends, so you can check for collisions from your computer, too.

Control Codes and Responses

Most of the following codes are addressed to a specific rig, which addresses an acknowledgement packet to the <TX> contained in the control packet. The first two codes, 00 and 01, can be sent to the "group call address" of 00, in which case any rig will receive them without sending an acknowledgement. These two codes are sent in this way by any rig when its mode or frequency is changed by manual control, and are received by any rig on the network. This allows a number of rigs to track each other in frequency and mode without computer intervention. Rigs can be inhibited from sending and receiving group call packets by an internal jumper. See Appendix 2 for more details. These codes can also be sent with a specific, non-zero <RX>, in which case they will be received by the addressed rig even if the group call function is disabled.

00 Set frequency. See above for format of frequency data. See code 05 below for more details.

01 Set modulation mode. One or two data bytes are required to indicate the mode desired.

Data Mode

00 LSB
01 USB
02 AM
03 CW
04 RTTY
05 FM
05 00 SSB (R7000)

02 Report tuning range. No data required. The rig will report its frequency limits in the format

FE FE <RX> <TX> 02 <upper limit> 2D <lower limit> FD

(Hex 2D is the ASCII hyphen.) According to ICOM, some rigs report the lower limit first.

03 Report frequency. No data required. The addressed rig returns its displayed frequency to the sender in the format

FE FE <RX> <TX> 03 <Frequency> FD

04 Report modulation mode. No data required. The addressed rig returns its mode to the sender using the codes listed above. Rigs with selectable bandwidth return an additional byte indicating the bandwidth. The format of the response is

FE FE <RX> <TX> 04 <Mode> <Bandwidth> FD

The bandwidth codes are:

Data Bandwidth

01 Width 1 (widest)
02 Width 2 (narrower)
03 Width 3 (narrowest)

05 Set frequency. The data format is given above. If the data contains fewer digits than the rig uses, the digits sent will be changed and the rest will remain the same. If the rig receives valid frequency data within its tuning range, it responds with a packet containing the data "FB":

FE FE <RX> <TX> FB FD

If it didn't like the data, it responds with the data "FA":

FE FE <RX> <TX> FA FD

These acknowledgement codes are used by all following commands.

The 735 responds to out-of-range frequency data by sending the "FA" acknowledgement and: 1) If the frequency it receives is less than 0.1 MHz, it sets its frequency to 0.1 MHz, 2) If it received 4 bytes of frequency data that is more than 30 MHz, it sets itself to 30 MHz, and 3) If it received more than 4 bytes of frequency data, the data is ignored.

06 Set modulation mode. If one byte is sent, it sets the mode per the above table. If two bytes are sent, the second is the IF bandwidth.

07 Set VFO status. If no data is sent, the rig changes from MEMORY mode to VFO mode. If data 00 or 01 is sent, the rig sets VFO A or VFO B respectively.

08 Set memory channel. If no data is sent, the rig changes from VFO mode to MEMORY mode. If BCD channel data is sent, the rig changes to that memory channel.

09 Store displayed frequency and mode into displayed memory channel. No data required.

0A Write frequency and mode from displayed memory channel to a VFO. No data required.

Examples

I will give a few examples of codes and responses for the 735. The 735 is at address 04 and the computer is at 02. First, let's find out what's in memory channel 1 (code 08 to set the channel, and code 03 to read the frequency). Assume the 735 has the frequency 7.12750 MHz stored in

memory #1.

Computer to 735:

FE FE 04 02 08 01 FD

735 to computer:

FE FE 02 04 FB FD

Computer to 735:

FE FE 04 02 03 FD

735 to computer:

FE FE 02 04 03 00 75 12 07 FD

Now let's change the frequency and mode to 14.02500 MHz USB (codes 05 and 06).

Computer to 735:

FE FE 04 02 05 00 50 02 14 FD

735 to computer:

FE FE 02 04 FB FD

Computer to 735:

FE FE 04 02 06 01 FD

735 to computer:

FE FE 02 04 FB FD

Now store the changed result back into memory #1. This channel is already displayed, so we need only the store command, code 09.

Computer to 735:

FE FE 04 02 09 FD

735 to computer:

FE FE 02 04 FB FD

Jumper settings:

For the R7000 -

The jumpers use lines DB0 through DB7 at connector J17 on the logic board. The address is set by DB0 through DB4, DB5 is the transceive enable, and the baud rate is set by DB6 and DB7. The factory address is 08.

If you have any other rig, you can determine its address by hooking it up to your computer and changing the frequency or modulation mode manually. You will receive a group call packet that contains as its 4th byte the address of the rig.

Uniden BC3000XLT
25 MHz - 550 MHz
760 MHz - 1300 MHz * cellular blocked

400 channels in 20 banks
Selectable AM / NARROW FM / WIDE FM
10 Priority channels
Selectable Attenuator on each channel
Instant weather search

Got mine for $350. Not totally satisfied with it, but it is still a good
unit.

>channel in time.

Actually, in Central Oklahoma, very few public service/safety frequencies
are in the 800 band. The OKC troop of the Highway Patrol is the only
police/fire group that I know of that uses 800 MHz locally.

A Southwestern Bell telephone building was about a block north of the
Federal building, and there was likely some disruption of landline
service in the immediate downtown area. They were asking locals to
refrain from using their cellulars so that the cel bands wern't
overloaded and that the police/firemen on the scene could use their
cel phones.

By the way, kudos to the OKC FD and PD. I was listening in on the FD
mainly, and they were very well organized and thorough. They did an
amazing job from the beginning, and are continuing to do so.

Unfortunatly it does mean that you can't receive them. VHF High band
has a 25khz ste, although chances are that it will be changed soon to
12.5, which those frequencies are at.

Well, with an FM scanner and discone you will be limited in what you
can hear. Here's some (from memory) you might try:

145.825 Several amateur satellites share this. Expect to hear
a 1200 baud digital signal for about 10 minutes at a
time when the satellite is overhead.

143.625 A few years ago you could hear Mir but I don't know if
it's still active there.

136.xxx US, Russia and China (I think) have polar orbiting
weather satellites here. Expect to hear a "dinging"
sound.

For more information you should hook with AMSAT. In your neighborhood
(relatively) the University of Surrey hosts a lot of amateur
satellites.

The reception (or knowledge) of what DPL code a system is using has no relevance unless you are attempting to monitor only one particular user. In the case of a trunking system (@ 800 or 900 mHz) the DPL has nothing to do with being able to monitor the system. Unless you can get your hands on one of the same manufacturers radio with the same trunking format you are probably going to have to put up with hearing the world intermittently.

Source record: 257751

Robert Casey (wa2ise@netcom.com) wrote:
: As everyone has undoubtly heard, someone bombed a federal office building
: in Ok. city today.

: The TV newspeople mentioned in passing that they heard on scanners
: various traffic about rescue efforts, 2nd bomb scare and resulting
: pullout, and such.

: Do the police and emergency people like the news to listen to scanners
: (thus the newspeople won't ask so many questions?), or are bothered
: by it (newspeople still get in the way and waste time?)

For the past 20 years I've worked in TV News in Phoenix Arizona. My
experience over the years....Scanner traffic gets reporters and
photographers to the scene. Reporters rarely ask questions about info
they heard over a scanner. The other source news agencies use is called
"media alert". It's a broadcast telephone system that allows
fire,police,etc. to advise agencies when a "major" event has happened.
It's a two way system so individual agencies can ask questions of the
person who is providing info on the news event. It's usually activated
by radio from the scene.
As far as Secret service, news agencies scan their frequencies, the
secret service knows this so many times puts out vague or coded info. to
throw the media off.
The TV station I worked for currently and in the past have rebroadcast
scanner traffic. Usually from a high speed chase, big fire or shooting.
I've never heard that it was illegal to do so. We've never been
chastised for doing it. Either from station or corporate law office.

1376. Why is my 2005 off by 10KHz on 800MHz?

Newsgroup: rec.radio.scanner
Date: 1995-04-27 00:00:00 UTC
From: brett_miller@ccm.ut.intel.com
Message-ID: <brett_miller.244.000CF851@ccm.ut.intel.com>
Source record: 257752

While I have not looked into the service manual yet, I was wondering if anyone else has seen this problem before.
My Pro-2005 is 10KHz off frequency in the ...uh.. upper portion of the 800MHz band. Frequencies in the 155 MHz, and 450 MHz range are on frequency.
On my AR3000 (and other scanners), the frequency matches what it should be, but on the 2005, I have to tune 10KHz above, in order to receive the frequency. While I believe this is in search or scan mode, I have only verified this in search mode so far. When I tune the frequency to read what it should be, there is no signal there.

Any ideas?

There's no such thing as an "ultimate rubber duckie" antenna.
They're usually considered to be just slightly better than
a dummy load. A telescoping antenna that can be optimized for the
frequency of interest would be a better choice for use with a
handheld.

1380. PR0-43 QUESTIONS, A/C and Speaker???

Newsgroup: rec.radio.scanner
Date: 1995-04-27 00:00:00 UTC
From: troy@sequent.com
Message-ID: <1995Apr27.190827.13633@sequent.com>
Source record: 257756
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I've recently purchased a used PRO-43 (1A4) and I have a few
questions.

o The sensitivity of the unit drops significantly in the 40-163MHz range
when the AC power converter is used. I've tried both (RS Part 20-188) of
the ones I own and they are both the same. They have no negative impact
on my PRO-51. The -43 will stop on less than 80% of the known good signals
that the -51 is getting. For example it has difficulty receiving the local
NOAA (162.55Mhz) signal. Is this common? Is there are way to correct the
problem? Does it need to be adjusted? Can the adjustment be done
without special equipment?

o The speaker of the -43 seems to get overloaded above 50% volume. Above
50% it also seems that it vibrates and ratteles like something is loose.
I've checked it and nothing is loose that I can see. Is this common?
I've seen posting's on replacement speakers. The speaker is glued in.
How is it removed and how does it get wired in?

Thanks,

Troy Wecker

<snip>

Memory is an often misdiagnosed problem. The designs used in the manufacture of newer Ni-Cads will normally prevent any permanent memory. If you suspect your battery has developed a "memory", a couple of full discharge/recharge cycles will normally bring it back right back to normal. If it doesn't come back, it may have a damaged cell rather than memory. Poor maintenance can result in cell reversal, venting or other damage. A bad cell in your battery pack may cause problems that are too often blamed on memory.

I have followed the following guidlines with every Ni-Cad I use in my HT, Norelco razor, cordless phone, drill motor, stuff at the office, etc. I have found this to be a good "do's and don't's" list. Some of this stuff was in MRT quite a while back.

DON'T

- CONTINUOUSLY discharge Ni-Cads at at rate more than 2X the capacity.
- Short the terminals - be careful about putting batteries in your pocket with keys, change, chewing gum wrappers, etc.
- Recharge cold batteries. They can burst, vent, leak or otherwise "break".
- Let Ni-Cads discharge to below 1V per cell.
- Reacharge wet batteries. Let them dry out before charging.
- Leave batteries on trickle charge for a long time.

DO

- Charge Ni-Cads at room temperature. 40F or warmer (60F for fast charge) The capacity and charging times on most Ni-Cads are normally for operations at 70F.
- Wait for low battery indicators before recharging. I wait for the "BATT LOW" indicators to start blinking on my phone and radios before recharging.

- Realize that rapid chargers (like the 1 hour type) will shorten the overall life of a battery by up to 40%. Most good Ni-Cads can take about 1000 cycles if cared for correctly and slow charged.
- Remember that most fast chargers (should) switch to a trickle charge rate before the cells are fully charged to keep them from overheating. A couple of hours of trickle charge is required to "top them off".

Following these guidlines my razor ran for a week on one charge over 5 years, the cordless phone will go 4 to 6 days (with my use), and I don't complain about the life of my HT batteries on my ham or commercial radios.

1383. BC3000XLT: Power up features

Newsgroup: rec.radio.scanner
Date: 1995-04-27 00:00:00 UTC
From: "D. Michael Grogan" <m_c_0007@frank.mtsu.edu>
Message-ID: <Pine.HPP.3.91.950427000837.16821B-100000@frank.mtsu.edu>
Source record: 257813

Here are some functions of the BC3000XLT that I have found that are not in the manual. You must hold the key down, and at the same time, turn the power on. I am not sure how many people know these, but I posted them anyway.

KEY(S) FUNCTION
==========
SCAN TOGGLE SCAN DIRECTION ON/OFF
MANUAL skips the welcome message
DLY TOGGLE BETWEEN 2 AND 4 SEC. DELAYS
LHT "ON LIGHT" allows light to
stay on continuously.
AUTO TURNS AUTO SORTING ON OR OFF
E TURNS BEEP ON OR OFF
SFT & 1 "test-1" ???
SFT & 2 "test-2" ???
SFT & 3 "test-3" ???
SFT & 4 "test-4" ???
SFT & 5 TOGGLES SAVE (battery?) ON/OFF
SFT & 6 allow or disallow
user selection
of AM / NFM / WFM
==========

If anyone knows any more of these functions, or knows what the test modes do, please post.

1384. Pro-2030 any good?

Does anyone know anything about the Pro-2030 base? Im aware its illegal but is it able to scan the cell phone frequences? I saw it for 399 bucks is that a good price (canadian dollars) ? It has 200channels and scans up into the 800Mhz range. If this is a shit scanner whats a good scanner that has alot of frequencies and is good for a begginer for a good price? Thanx

Wade

1385. ?? Digital Encryption ??

Scott, you cannot modify any radio that is being made now--your only
chance is to find on still on the shelf that was manufactured before the
new law took effect (last summer I believe). With Radio Shack products,
the letter "A" in the serial number is a giveaway that the radio cannot be
modified. I don't know if there is such a clue for Uniden or not.

1393. Selling price for my Pro-51 and recomendations for new one?

Newsgroup: rec.radio.scanner
Date: 1995-04-27 00:00:00 UTC
From: bobszabo@ix.netcom.com
Message-ID: <3nodoi$dm8@ixnews3.ix.netcom.com>
Source record: 257823

Now that I have been into scanning for a few months and have no complaints about my Pro-51 I have a few questions.

What would be a good selling price for my Pro-51? It can be modified for cell with the keyboard mod.

Do I really need another scanner? Maybe a dumb question but a few of my concerns are:

1. Would like to here military. Is there really much in the 200-400 range that I could here anyway? I am in the Northern VA area and think that there should be.

2. What will being able to select AM-Wide or Narrow band FM do for me?

3. Would like a portable and would like to interface it to my computer. Is the AOR scanner the only one that will do this.The main reason for wanting this is to program freqs. in.

Sorry for all the questions. Appreciate any help that can be given.

Bob

To that individual that wanted info on Softwave; (the ID didn't come through); if this is the same company, and I believe it is, forget it.....The company I was thinking was the same one Larry Magne did a review on several months back that incorporated a HF (and I think they had a VHF option) into a PC. Basically he said that it had some possibilities, but also needed some additional work.
A couple of months later, it seemed that the company was no longer answering phone calls, and all software support for the item was gone. This was mentioned by Magne and Hauser, along with a short blurb in 'MT', I believe. If you take a good look through the 1994 issues, I think you'll find what you are looking for.
Might be an academic issue though; it seems like the company has gone belly-up.

: > (possibly
: > HF???)? I have heard about monitoring 220mhz to get some, but haven't found
: > anything... I know they are there, but WHERE????
: >

: The Military aviation band is 220-400MHz. Your PRo-46 does not have this
: coverage I'm araid. You may find some activity on the VHF frequencies
: allocated to your local base but unlikley.

: What base are you near ?

: If you do have a UHF (220-400) capapble scanner the art of finding
: active discret frequencies such as Air-Air's, Air Refuelling, Operations
: and others is to use the search fac8ility but just search small
: segmants. Spend a hour or so just seraching 5 or 10MHz rather than the
: whole 220-400 spectrum.

This is going to be really simple. Start scanning from 148.010 to
150.000 Mhz. Most MP's (Army/USMC) and Security Police (USAF) are
located in this range. A scattering of fire and base services can be
found in that range as well. Don't scan fast since transmissions by
policy are short. At one base that I know very well (hint hint) aircraft
can be found in the 800 Mhz range, however these are scrambled in most
cases.

In any case military frequency's that are used at one base for say
security police may be used for base op's at a different base. But they
all use the same frequency sub-pool. It's done this way for a reason,
and I am sure you can figure that out.

Do not expect to hear ID's or a repeater ID. In fact, you will hear them
and not know you are hearing them until you start getting detailed about
what you are hearing. In other words, don't expect to hear somthing like
Hey I am at the front gate of El Toro Marine corp air base. Do not

expect to hear anything on a "crash crew" frequency unless there is an IFE in progress. Do not expect to hear anything on a "fueling" frequency. The fuelies will not TX a signal while loaded.

Lots of HT's are used on bases, so you will more than likly need a beam antenna. If you are near a training base do not expect to hear much other than fire and police. If you live near a specialized base good luck you are on your own :-)

I've got the hardware if you can whip up your own software.
My unit connects to your RS-232 port. You can do the basic functions
using a COM program on your MAC but anything beyond that requires custom
software and I don't own a MAC to do it with.
The PRO-232 interface comes with database software for the PC

I'd bet your "Upsatate New York listing" is just that...a listing
whereas something like Scantrix or Haruteq is a book full of frequencies
covering the majority of the vast province of Ontario (a MUCH greater
coverage area than Upstate NY.).
So your book (or listing) is a freebee ?! Very good !
Thats' awfully nice of you to spend your time and money to offer hard
copies of such information.
I suspect that David's Scantrix guide costs him quite a bit of cash to
get printed. Only fair to command at least his cost in making this info
available and as I pointed out, I'm sure he does the best he can to
ensure the accuracy of that info...not an easy task for such a great
area. Mighty nice that you can eat this cost yourself ! <g)

You sound like you're his competition or something with comments like the
ones you made ! How about some constructive advise like.." Hi
David...here's a few tips on how I manage tracking the use and accuracy of
frequencies for my list...OR...here's how I verify info on frequencies
that has been given to me..."

Regards...Hugh...

Hi there- keep in mind that NJSP and GSP are 2 different entities; however,
in reading the latest issue of 'NatScan', it seems that NJSP has moved onto the
800 mhz frequencies. Apparently common Troop B frequencies like 155.19 are
gone, according to the article.
Likely as not Troop E has followed suit.

See ya....Mike Agner KA3JJZ

"D. Michael Grogan" <m_c_0007@frank.mtsu.edu> wrote:

>I was just wondering what the press does about digital scrambling by the

>police. Do some agencies provide a radio or descrambler to the press

Though I have heard of some public safety agencies offering trunked portables to the press (with transmit disabled), I am not aware of any agency that offers -encryption capable- equipment to the media.

>must the press begin relying solely on police sources and press releases

>when a city begins scrambling?

There are a myriad of new and efficient ways for Public Safety agencies to assist the media. It's not the equipment that's important.....it's the commitment of the people that run it!

We must remember that it is inappropriate and unethical for the media to build a story based -solely- on monitored radio traffic.

> What about major emergencies when the press like to be on the scene?

Agencies such as ours go to great lengths to immediately alert the media to a newsworthy incident.

>If I were a police reporter, I would feel that I needed to have some way

>to verify what the police were telling me . . . some way to hold them
>accountable to the public.

One of the biggest difficulties that reporters face is understanding the difference between "like to know" and "need to know".

Please remember that in nearly all situations, Public Safety agencies have little if any legal obligation to tell the media what they are doing while they are doing it. Now that's not to say that we can hide from public scrutiny!! Remember that States have Public Record Acts. While they can inhibit the immediacy of some coverage...the PRA's assure that nearly all information is available to the public (including the media).

>And, one more thing, do you ever think that we will see a day when
>technology defeats technology?

There will always be a battle of technology, however our Defense industry and related businesses will labor to stay at least one step ahead. I do anticipate that the FCC will take great strides to prohibit digital descrambling devices.

Happy Monitoring!!

I'm going to the Super Truck race at Evergreen Speedway in
Monroe, WA on May 13.

Anybody have a listing of frequencies used by the race teams
and/or NASCAR officials?

Thanks,

David Branson

This is backwards from my experience - I pick up low VHF (30-50 MHz
range) *better* with the charger plugged in. It may depend on how
your wiring runs - try it in other wall sockets and see what you get.

>o The speaker of the -43 seems to get overloaded above 50% volume. Above
>50% it also seems that it vibrates and ratteles like something is loose.
>I've checked it and nothing is loose that I can see. Is this common?
>I've seen posting's on replacement speakers. The speaker is glued in.
>How is it removed and how does it get wired in?

The internal speaker is crud, esp. at high volume levels. There is a
mod available that supposedly improves the audio. Earphones help, but
the keypad beep will pop your eardrums.

Keep in mind that the Pro-26 is not a replacement for the Pro-43.
No, I haven't heard much about it here or on Compuserve. I'm
waiting to see the Pro-60 this weekend and Dayton.

Oh, and of course, NO NO NO NO. Any scanner manufactured after
the deadline last year (for US SALE) is not SUPPOSED to be
easily modfiable for cellular.

Just out of curiosity, are you in the metro St. Louis area - -
I used to work with a Tim Henrion.

1408. SCAN-L List Is Here!

Newsgroup: rec.radio.scanner
Date: 1995-04-28 00:00:00 UTC
From: domonkos@access.digex.net
Message-ID: <3nrhge$srb@news1.digex.net>
Source record: 257681

Check out the following, let's make good use of it!

Andy

Fellow Scanner enthusiasts:

A new mailling list has been created just for you. SCAN-L is devoted to enthusiasts who monitor the radio spectrum above 30 MHz. Posts relating to any facet of scanning are welcome here.

This is not an RCMA list per se, but you are among the first group of people to be offered a subscription :-) The email directory will *not* be distributed here and will continue to be separate in keeping with the spirit of RCMA's privacy policy.

To subscribe to SCAN-L, send a message to listserv@uafsysb.uark.edu with the message 'subscribe scan-l Your Realname' in the body (no quotes). No subject line is necessary. For more information on listserv include the word 'help' on a separate line of the message.

This is an L-SOFT brand mailling list and, as such, supports all listserv functions like digest ...

Peter Laws,
Associate Editor - Arkansas,
RCMA _Scanner Journal_,

Peter Laws<plaws@comp.uark.edu>|"Suppose you were a politician. Now suppose yo
u
n5uwy@ka5bml.#nwar.ar.usa.noam |were an idiot. Ah, but I repeat myself."-Twain

SCAN-L FAQ v1.0

This list was set up to provide an electronic place where folks in the scanning community can discuss activities related to scanning. Scanning is described as monitoring nonbroadcast radio transmissions above 30 MHz.

It might be helpful to think of SCAN-L as an ongoing, virtual club meeting. Feel free to participate. It is only through active use that a "virtual community" will evolve. The list is "self-moderated"--you are responsible for what you post. Neither foul language nor threats against individuals or groups will not be tolerated and will be dealt with appropriately.

Remember that a message to LISTSERV@UAFSYSB.UARK.EDU goes to a machine, not a human, so it must be a command, while a message to SCAN-L@UAFSYSB.UARK.EDU will be sent to everyone on the list.

Commercial content must be limited offers to buy, sell or trade scanners or other radios regularly used for monitoring the radio spectrum above 30 MHz. These offers must come from individuals not regularly in the business of buying and selling said items. New Product announcements may be forwarded to the listowner for possible distribution.

Thsi list is not and will not be gated to any Usenet news group. rec.radio.scanner is a fine newsgroup. SCAN-L will be too. Reposts from any rec.radio.* are welcome here with the restriction that headers must be trimmed and may only contain From, Newsgroups, Subject and Date lines.

Note: As used below, LISTSERV refers to LISTSERV@UAFSYSB.UARK.EDU or LISTSERV@UAFSYSB (depending on your mailer, you may have to use LISTSERV@UAFSYSB.BITNET). Single quotes around a command shouldn't not be sent, but are there for clarity.

Q1. What is the network address of SCAN-L?

A1. The address of SCAN-L is SCAN-L@UAFSYSB.UARK.EDU

Q2. What if I have technical questions about how to get SCAN-L?

A2. If you run into difficulties:
1. Consult a local network whiz.
2. Contact the list owner, Peter Laws <plaws@comp.uark.edu>

A local contact is usually preferable because each site has a unique combination of hardware and software.

Q3. How to I post a message to everybody on SCAN-L?

A3. Send your message to SCAN-L@UAFSYSB.UARK.EDU. The list is not moderated, but you must be subscribed to the List before LISTSERV will let you post. Use a descriptive subject line. Many people decide whether they want to read a message based on the content of the subject line.

Q4. How does somebody subscribe to the list?

A4. Send a mail message to LISTSERV with 'subscribe SCAN-L Your Real Name'. Note that Your Real Name is *not* your userid! (Obviously, if you're reading this, you already are a subscriber, but it is easy enough to forward this note to someone who has never heard of SCAN-L or even BitNet, for that matter.)

Q5. How do I leave the list?

A5. You just subscribed and now you wanna leave? :-) To unsubscribe and leave the list, send the command 'signoff SCAN-L' to LISTSERV. This command must also come from the address from which you originally subscribed, so the LISTSERV can find the exact match.

Q6. Vacation's coming. How do I just "suspend" SCAN-L for a while?

A6. If you don't want to receive mail temporarily (if you are leaving for a vacation, for example), send 'set SCAN-L nomail' to LISTSERV.

To start it again when you return, send 'set SCAN-L mail' to LISTSERV.

Q7. I want to follow SCAN-L, but I don't want messages arriving all day.

A7. Send the command 'set SCAN-L digest' to LISTSERV and it will save all the messages for the day and send them in one batch every day.

Q8. I don't even have time to read the digest . . .

A8. Send the command 'set SCAN-L index' to LISTSERV and you will get only a list of subject lines once a day with instructions on how to get any particular message you might want.

To change back to the regular postings from either DIGEST or INDEX, send LISTSERV the command 'set SCAN-L mail'. To check your distribution options, send 'query SCAN-L' to LISTSERV.

Q9. How can I get a list of everybody that is subscribed to SCAN-L?

A9. Subscribers may send the command 'review SCAN-L' to LISTSERV and a list of all SCAN-L subscribers will be sent to you as email.

Q10. Can I see what has been on SCAN-L in the past?

A10. Yes. Each message is archived in a "notebook." One notebook contains everything that has been sent to SCAN-L for a month. For instance, to get the notebook for April 1995, send the command 'get SCAN-L LOG9504' to LISTSERV. The first two digits indicate the year and the last two indicate the month.

NETIQUETTE

The cryptic, often-uninflected style of email writing can result in messages being interpreted in much harsher terms than the writer intended. All too often, this leads to "flame wars" resulting in waste of computer resources, hurt feelings, and a general disaffection. Biting criticism and personal attacks are unfunny and unwanted. Remember, there is a real person on the other end. You are responsible for what you write. Finally, be aware that it is a trivial job for "someone" to monitor electronic mail or any discussion list. It is also extremely easy to save any message and to forward it electronically or repost to another list tomorrow or in 10 years.

This FAQ was updated on 1995.04.28 by plaws@comp.uark.edu (owner SCAN-L).

It is heavily based on the FAQ for CARR-L (Computer Assisted Research and Reporting List), Owner: Elliott Parker <3zlufur@cmuvm.csv.cmich.edu>.

1409. need San Diego freqs

Yep, that sure is stupid. Obeying speed limits won't make a good driver, of course the opposite is also true. But remember, you're not the only one out there and the law also protects you and me from all those jerks on the streets. An experienced driver will always choose his speed considering a variety of variables like traffic, weather etc. But, there are people out there who are unable or unwilling to do act in such a reasonable way. Enforcing the law will have very little positive effect on their behaviour. Keeping the average speed on freeways at a low level might prove to reduce serious crashes, but its definately not going to make the basic problems with uneducated drivers go away. How about proper driver education, controlled by the state or the insurance companies?
How about a fair deduction on you annual car insurance fees when taking a bi-yearly test at an approved driver education centre?
And, as long as virtually anybody can get a drivers license by simply paying $20 for it, what can we really expect in terms of safe roads?

> The same people who yell at me for doing 80 and "endangering" their kids,
> are the same people who drive their minivans full of kids with no seatbelts,
> bobing all over the car, and making faces at cars in the rear window. But,
> hey! I'm reckless.

Right, I never quite understood that when I visited the U.S. So many people don't seem to bother wearing their seatbelts, it really scared me.
When buckling-up became mandatory in Germany (must have been in the early 80's) cops where all over the place ticketing violators. Now that was really a nice move. Nowadays, you very seldom see a driver without wearing a seatbelt. If you forget, you can be sure the first cop to notice will at least tell you, or possibly issue a ticket. Now, enforcing the law regarding seatbelts would certainly be a useful job for the Oregon state police, actually saving some lives in the long run.

Thats your problem, it means July 1994, and Rat Shaft stopped making
Cellular Modifiable Scanners in March of '94.

Sorry to Burst your bubble bud, but you need to go find a used scanner with an
earlier date code, one BEFORE 4A4...preferably with a last digit of 3 or less,
also, usually if the Serial number starts with an "A" it is NOT modifiable.

I've experimented with a Larson 450 MHz glass-mount antenna and the
AM/FM power antenna in both my old Supra and my 4Runner.

The AM/FM antenna definitely works better below 150 MHz or so,
probably due to being longer in length, and because the coupling
system through the glass is designed for 450 MHz operation.

There's no substitute for a longer antenna!

Modifications for the Radio Shack PRO-38 10ch scanner

These PRO-38 modifications may also apply to the current PRO-41, and
the Uniden BC50XLT and BC55XLT scanners, which appear to be the same
unit in different packaging.

Initially I wanted to enable my scanner to receive TV audio bands, just
for fun. This started a quest for modification information, and I
learned a lot about what can and can't be done with a scanner.
Unfortunately, I didn't learn until after I performed this modification
that TV audio (and FM radio) is broadcast in WFM (wideband FM), but
most scanners only receive NFM (narrow-band FM). This results in
major garbling of the sound when the scanner is tuned to a TV audio
frequency.

Anyway, on with the modification. I purchased the Realistic Service
Manual for the PRO-38, part number 20-139, for a paltry $5.28 and a
1 week order delay. In it I found quite a bit of useful information.
It contains full board layouts, a block diagram, a detailed schematic,
and some pinout information for the UNIDEN UC-1143 microprocessor
which controls frequency selection. This is in addition to the test and
alignment procedures. There is even a nifty reset/test mode [WHICH
ERASES STORED FREQUENCIES!], switch on while depressing 2-9-MANUAL.
This programs all channels to test frequencies.

The first thing I found was the ability to select U.S. or European band
coverage, through a jumper on the CPU board. Installing this jumper

(normally missing in the U.S.) changes the VHF-low frequency range from 29-54MHz to 66-88MHz. This looked very much like what I wanted for at least some of the TV audio reception. But it sounded like garbage, then I found out about WFM/NFM... So I removed this mod (I don't know of any frequencies in that range that would be useful).

I looked through the service manual some more, and found that there were 3 pins on the processor that appeared to be inputs (from the test voltages given in the manual) yet were not used or given any other designation. I grounded each one of these pins, as I did with the European mode jumper, and tested the results. Only one of them made any difference, and it too is probably useless. What it did was to change the VHF-high frequency range from 136-174MHz to 118-174MHz. This extends the frequency coverage into the aircraft band, but this band is AM, and this radio does not have any AM detector circuitry (as far as I know).

I was hoping that some magic pin would enable 16 channels (as on the similar mobile PRO-2025), but I couldn't find one. There is the possibility of more keys being added, as the scan matrix is 3x8, but only 16 keys are used (8 more could be added). The PRO-2025 has 2 more buttons, PRIORITY and WX (weather), and both of these features would be nice. Maybe someone else has some ideas? I was thinking of getting the PRO-2025 service manual, to see the differences, but I may just get a better scanner and be done with it :-)

If anyone out there can come up with more modifications or information about this scanner, please let me know. There are quite a few of us out there that have simple scanners like this, and we would like to get more out of them. Not all beginners go straight to a PRO-2006, after all :-)

THE MOD:

European band selection:
1. Add a jumper to the digital board, connecting the empty pads near the upper left corner of the IC when looking at the board from the component side (display up/speaker down - facing away from you). When completed you should be able to power up and enter frequencies in the 66-88MHz range, with frequencies in the 29-54MHz range resulting in E(rror). Note, it should be possible to place a small switch on this jumper so that the unit can change from European to US modes (probably only when powered off). Once a frequency is entered into memory, it can be received no matter what bands are enabled.

FM "Air-band" coverage:
2. Add a jumper between pin 67 of the microprocessor and ground. Pin 67 is one down from the pin connected to the pad used in the European band selection, it is the third from the top on the left side of the chip. Ground can be obtained at the opposite side of the European band jumper pad. Be very VERY careful while soldering to the pins of the surface mount chip, and have

a VERY fine soldering iron tip.

Once the jumper is in place, frequencies can be entered in the
118-135MHz range, and no other range is lost.

oresponsibility for any errors on your part (or
on my part for that matter), you have another thing coming. No warranty
is expressed or implied. Use at your own risk.

That's why I started writing scanner books myself. But if
somebody is going to ask people to send money for a
listing, they should be conscientious enough to put some
effort into making sure it's accurate.

I rate any scanner listing based on what I already know.
If information known to me is incorrect, why should I rely
on it for information that I don't already have?

>
I tried the Pro-51 keyboard codes on my new Pro-26 (datecode: 2A5)
just to see what would happen, here is what I found:

Holding L-OUT, 2 & 9 while turning on the scanner does load
a bunch of test frequencies, none of them are "magic frequencies".

Holding SHIFT, 2 & 9 causes the display test to occur. Switching
to L-OUT, 2 & 9 while the display test is running does cause a
different set of test frequencies to load but still none of them
are "magic frequencies". The closest one is 850 Mhz. Bummer.

Holding KEYLOCK, 2 & 9 causes the following text to display when
the scanner starts up:

6b4dH (I assume that this is either a serial # or a checksum)
USA 1.00

Yes it is 46/49 MHz. It uses voice inversion "scrambling" and is VERY easy to unscramble. It also has poor audio quality.

> lives in the long run.

Ahhhh. But you see.. There is no money in giving out seatbelt tickets
($85 vs. $325-$512). Insurance rates don't go up either. If your rates
DID jump, I'm sure we'd see a "Seatbelt Radar Guns" given out by GEICO.

Scenario--- Your a cop. In the U.S. (We'll say Oregon). You see A) A red
compact car going 85 MPH then you also see B) a minivan with kids
bouncing all over the place in the left lane doing 70 MPH.

What is your response:

A) Pull the Red car over---He/she's doing 85, obviously on a death wish.
B) Pull the minivan over--- He/she is endagering the kids by not having
them in seat belts. He/she is also in the left lane in the way of faster
traffic. Another hazard. He/she is probaly being distracted by the kids.

Which do you think is going to happen here in the states?

I think we all know the answer.

>How are they "secure"?? scrambled??
>
>I am thinking about getting one, how hard is it to descramble?

Here is my advice, for what it is worth. Go spend $10 - $20 more and get a 900 Mhz spread spectrum phone. I purchased the Motorola cordless and frankly was very unhappy. The usable range of the phone was horrible, and it seemed that there was a major echo in every conversation.

I returned the phone and got an AT &T 900 Mhz and love it. It has great range and as far as I know, it is impossible to listen in from a scanner.

Hope this helped,

Spider

Bob:

You can't go wrong with a discone. You'll get substantially better improvement than your mobile whip (most likely). Be sure to get one that includes the whip part on top for the 46Mhz range, especially since you live in an apartment.

Happy bug hunting.

good luck in doing it, if it is motrola dvp or GE voice guard or any
scheme that uses a DES algrorythem you are shit out of luck dude
unless you have access to cray super computer or are willing to pay
a commpany that does a million bucks to do it for you.
Useualy only sensitive comms. are srcambled.Main dispatch freqs. useualy
are not.
One morning last fall i was listeneng to local pd and heard a call.
An off duty P.O was strugling whith a robbery suspect that shortly
before commited a robbery which i also heard about.then a call came
over that a citizen whith a scanner noticed the strugle going on
and called in the location, possibly saving the the officer from
death or serious harm.Most P.O. & F.D. & pulblic service people
have a scanner at home and often in the car too.There have been
many incidents in which a scanners have played a role in saving
lives.WHY ANY public service agency would scramble general dispatch
is beyond me.

Message-ID: <3nrll5$l9d@hptemp1.cc.umr.edu>
Source record: 257721

Does anyone know anything about the big amber plastic blob that you stick on the end of an antenna and it improves the reception?

It's been touted to improve any antenna in any frequency range.

Sounds too good to be true.

>
> -Art

I've got the hardware if you can whip up your own software.
My unit connects to your RS-232 port. You can do the basic functions
using a COM program on your MAC but anything beyond that requires custom
software and I don't own a MAC to do it with.
The PRO-232 interface comes with database software for the PC
Leave me e-mail if you want further info !

Source record: 257724

Hi there- keep in mind that NJSP and GSP are 2 different entities; however,
in reading the latest issue of 'NatScan', it seems that NJSP has moved onto the
800 mhz frequencies. Apparently common Troop B frequencies like 155.19 are
gone, according to the article.
Likely as not Troop E has followed suit.

See ya....Mike Agner KA3JJZ

I read an article recently in a computer magazine that said that even though the US Government is looking in filing charges against Phil Zimmerman (PGP), he is developing PGP-Voice for phone conversations to make them as secure as PGP encoded messages.

1456. Re: The Media and Digital?

Newsgroup: rec.radio.scanner
Date: 1995-04-28 00:00:00 UTC
From: ad225@detroit.freenet.org
Message-ID: <3npj8f$sgd@detroit.freenet.org>
Source record: 257762

The answer to the question about digital scrambling and its impact on the news media can be summed up in one word: "frustrating."

It does make it more difficult for us to keep the public informed, especially if the police department in question is not forthcoming when reporters call for information. Some departments are very cooperative. Others stonewall or even lie over the most insignificant things.

Experiences shows, however, that those departments which cooperate get better media coverage than those that don't. Enlightened police officials endeavor to develop relationships with reporters who cover their departments on a regular basis.

However, it should be noted that the scrambling of police signals is typically directed less at the news media and more toward thwarting the bad guys.

|Well, being bored the other day, I was looking at the cable for my
|rooftop TV antenna that I no longer use since I got cable, and I thought
|what the hell, hook it up to the scanner. I did, and it worked surprisingly
|well. Sure illustrates the fact that higher is better. It worked better
|than any of the other antennas I use on my portable.

Well, if this were a scientific experiment, your conclusion wouldn't
be warrented based on the fact that you didn't use the SAME antenna
at both ground level and on the roof. The TV antenna has gain in the
horizontal plane, on the other hand, the coax introduces lost; without
knowing what those actually measure out to be, you couldn't be certain
if in "that higher is better"... you would only know that height MAY
have contributed toward better scanner reception...

>They are on SOD 470.8375
>They also can be found on the frequency of the particular precinct that
>they may be doing a search for at any given time...

They are also on the regional air traffic channel 118.???. And possibly on 156.8 mhz VHF channel 16 (marine). When over water or operating with boats. It depends on the pilot. I talked with a few of them, most can't be bothered listening to all the above channels, it's too much while flying, but some do especially when they're bored. They're equipment is quite capable.

The Harbor launches can be heard on VHF channel 17, usually talking to each other. The Coast Guard is on a multitude of frequencies, but most of their radios are DES encrypted, you usually only hear them talking with other boaters or agencies.

Enter these freqs to the next closest channel your scanner will step to and
chances are you will still hear the signal since the selectivity of these
scanners is so poor and the zeromatic function will assist you.

Curtis Wheeler <cgwh@chevron.com> wrote:

>Technically - yes you could. But since effective trunking technologies are full duplex
>operations I don't think it would be a desirable band to work with. The 800 and 900 bands

Full duplex is only used for phone patch links. None of the trunked systems require full duplex for two way communications. The clearchannel LTR system radios do a half duplex data handshake on key-up. The motorola trunked system does the same, except at a higher data rate & dedicated data channel. Basically all that has to be done to trunk on other bands than 800/900 is to put the trunking brain board (cpu) into a vhf/uhf radio. There are small SMT boards made that will make any vhf/uhf radio trunk, as well as make them remotely programmable.

I *really* wish you hadn't done this.

The increasing amount of space spent in the FAQ's that has gone to RadioMap has always worried me (2-3 screenfuls now?), yet your posts/faq's also contain valuable information. You are also a 'senior' (as much as one can be on USENET) member of the group, ...

Yet, in the 16 years that I've spent using the net, watching it go from a very useful research tool to a place where there are ten "I 'need' ____", "Buy ____", "How do i (insert something that was just covered)" for each useful post, I really can't seperate this blatant plug from those that completely fill some groups, hawking their wares.

Yes, it is on topic, but so are the hundreds of 'mac forsale' messages that threaten to flood and engulf the macintosh groups. Yes, it is useful to some, but so are many of the other things now peddled in the various groups. Yes it is unique to scanners, but it more than adaquately covered in your own FAQ's.

I left your message in my news queue for a couple of days, in a vague hope that it would expire before I got around to replying, but, well, I couln't ignore it any more. Often i put in a little time each day helping with the net-abuse groups (news.admin.net-abuse.misc), trying to get rid of the MMF (make money fast) & other spams. And while this was no where near their level, it saddened and bothered me far more than they ever do.

: >to minimize SWR in the 139MHz to 143MHz frequency range.

: >Also, I read somewhere that SWR is not important if you are
: >only receiving a signal. Is this true or is it hogwash?

: When you are transmitting, the transmitter is the source,
: and the antenna is the load. When you are receiving, the
: antenna is the source, and the receiver is the load. So
: what you really want to match to minimize SWR on the line
: is the coax to the receiver. Since that's normally already
: done, SWR from a mismatched load is a moot point.

This is incorrect, particularly when talking about typical
low noise VHF preamplifiers. Although the input impedance
isn't anywhere near 50 ohms, it wants to *see* a 50 ohm source.
True, a conjugate impedance match will result in maximum signal
transfer. Except that on receive you want maximum signal to noise,
not maximum signal. A mismatch between the antenna and the coax
can result in a high noise figure (or noise temperature.)

As a practical matter, however, many people in urban enviroments
have a rather high background noise level, even at VHF. Thus,
the degradation may not be significant, unless the system is
moved to a low noise location (or a widespread power failure
turns off most of the noise generators...)

Thus, you may find little improvement in optimizing the
impedance matching, simply because the weak link in the
system is the background noise. An analogy might be looking
at stars--in a big city you can't see very many, no matter
how good your vision. Of course, if you use a really big
telescope (antenna) to filter out the stray light (noise),
better vision may help.

Most people would't bother with the inversion, wich makes inversion
better than nothing. Most people are trying to thwart the casual scanner
user and inversion works fine for that (I would still refrain from giving
your credit card # over this phone). If you want security, use a
900Mhz digital phone. These use inversion but use 8 bit DES encryption;
much more secure. Granted, with only 64,000 possible codes 8 bit DES
isn't uncrackable, it would be a pain in the ass. The only way to break
it is to try every one of the codes (with a computer) until you get one
that sounds like a human voice; very time consuming.

1473. UPDATED> Mesa AZ Frequencies WWW Page

Newsgroup: rec.radio.scanner

The only thing that I think I could ask for on the Pro-60 as
opposed to the Pro-26 is more channels. I wonder how much more
the Pro-60 is going to cost than the Pro-26 if it does, in fact,
have more functionality. I think that $400 for the Pro-26 was my
budget limit so I don't feel too bad not getting a Pro-60. :-)

Interesting, the Pro-26 does the same thing with the same
keysequence. Could these radios be similar hardware inside?

>
> See my BC3000XLT review in April 1995 Monitoring Times. It contains
> a table of other undocumented keypad tricks I found.
>
Have you looked at the Pro-26 yet? I'm curious to know if
you might have found any keypad stuff that I haven't found.
All I've found so far are:

1) The above checksum/rev thing
2) L-OUT, 2 & 9 to load the first test freq set.
3) SHIFT, 2 & 9 to run the display test then L-OUT, 2 & 9
during the display test to load the second set of test
freqs.

BZZZZZZZZT - wrong, but thank you for playing. The step size in VHF high is 5 KHZ. The frequencies he is after are using 2.5 KHZ and will be received just fine on most scanners. You are thinking of the UHF range when you talk of 25 KHZ steps. Even on UHF, 12.5 KHZ steps have been in use for some time now...

I just talked to my local RS dealer and the only information
that he had on the Pro-60 was a catalog number and a price.
The retail price is $349.95. This scanner may well be the
the replacement for the Pro-43 but it is clearly positioned
below the Pro-26 (at $399.95).

> Just got a new scanner and really enjoy it. Does anyone know if there
> are any known birdies, the manual doesn't list them. Also, are there
> any known mods for this unit yet? Thanks!

There are a couple of undocumented features:-

Keyboard Beep On/Off can be selected by pressing 2nd.F + BANK

If you want the TR-2400 to be in manual mode when you turn it on press
MANUAL + ENT + ENT. If you would prefer it to scan when turned on press
SCAN + ENT + ENT.

Regardless of what mode it is when you turn it off it will always start
in one of the above.

You can also have the "hold" facility work when scanning but I can't
remember the 2nd.F + ??? off the top of my head - sorry.

Uniden BC-2500XLT for sale.

For those unfamiliar with the radio, this unit has 400 channels in 20 banks. Banks 1 through 10 have Priority capability on first channel of each bank. Turbo Scan allows scanning of up to 100 channels per second. Frequencies covered: 25 - 26 Mhz (NFM), 26 - 29 Mhz (AM), 29 - 54 Mhz (NFM), 54 - 72 Mhz (WFM), 72 - 76 Mhz (NFM), 76 - 108 Mhz (WFM), 108 - 137 Mhz (AM), 137 - 174 Mhz (NFM), 174 - 216 Mhz (WFM), 216 - 225 Mhz (NFM), 225 - 400 Mhz (AM), 400 - 512 Mhz (NFM), 512 - 550 Mhz (WFM), and 760 - 1300 Mhz (NFM) (less cellular).

The unit is in good condition and has had NO modifications performed on it. Asking $250 and I will pay 2 day shipping. Other reasonable offers and trades will be considered.

Please reply to chdaley@kd4lxq.radio.org or I can be reached at (404)-475-8140.

Thanks,

Chuck Daley

Source record: 257600

Hello,

I live in an apartment. I have an outside balcony where I have a mobile type antenna I use for scanning. This mobile antenna does improve my reception quite a bit. What I would like to know is would a Discone or similar base type antenna help me get better reception. I know it would of I could get it up in the air on a mast but I can't. It would be under the roof of the balcony above me and quite near the building. Should I try one anyway or just use the mobile antenna?

Bob Szabo

Reply follows:

No, a discone will NOT help you. In my opinion stick with what you have. A discone is essentially a unity (no) gain antenna, it's advantage is a rather wide bandwidth as opposed to an antenna cut for a single band.

* In a message originally to JBD@SPCFS2.NSC.COM

J>.find any information related to extending the PRO-51's
J>.frequency range via keyboard sequence. Anyone know about

Pro-51 and 23 only!

1. With the radio turned off, press and hold the 2. 9. and LOCKOUT keys; turn the radio on and release the keys.

2. Step to channel 23 on the PRO-51 or channel 15 on the PRO-23 to display 888.960 Mhz. a factory test frequency.

3. Press either the up or down search arrow to scan the cellular band in proper 30 KHz steps. You can temporarily store up to ten active cellular frequencies by pressing MONITOR.

Permanently store these frequencies for scanning and searching:

1. STEP to the desired MONITOR channel and press PROGRAM, followed by the desired memory channel number (including those with

factory-pre programmed test frequencies).

2. Press in sequence PROGRAM, MONITOR. ENTER. Repeat steps 1 and 2 for each channel to go into memory.

Source record: 257602

I'm thinking of buying a glass mount antenna for my car and scanner.
Since I prefer not to drill holes in my car or use a mag-mount, I
quite like the idea of the glass mount antennas. But common sense
(and not knowing how these antennas really work) tells me that they
can't be as good as antennas connected with an uninterrupted wire.

If anybody has one, could you tell me if it is worth buying one ?

Thank you very much,

Jan

The choppers usually can be heard on 470.8375, but they have the
ability to talk on most any of the city police channels. If they are
searching for someone and the search is under control of another
citywide channel they may talk on that - or even on a prct channel.
Sometimes you may hear them talk about the "company frequency". that's
the aviation channel to talk to their base 123.3.
It should not be hard to find the chopper if you are listening to ny
police radio.

>range. What I would like to know is what is the fromula for calculating
>the length for the 100-200mhz range. I would like to cut it for that
>length.

The formula for the approximate length of a 1/2 wave
dipole is 468/freq.(in MHZ)=length(in feet). If you
are using a mobile application the vehicle body acts
as one side of the dipole, so you halve the length.

A mobile antenna for the 144-148 MHZ ham band is
about 19" long.

These lengths are for simple conductors. If the antenna
you are using is less than 102" long, it is using
some sort of matching device which makes these
measurements useless.

A conductor cut to an odd multiple of the resonant
length works as well or better than than an
antenna cut to the formula. A 102" full size
mobile CB antenna cut to 96" (5 quarter waves)
will work great on the ham 2meter band.

Secure phones do exist, but they are expensive. There is no law on the books prohibiting secure phones, and nobody who manufactures phones is under any obligation to have their products approved by the NSA, FBI, CIA or anybody else unless they plan to export them. The use of unbreakable encryption is perfectly legal in the United States.

1499. FREQ? DuPage (Illinois) Channel 5

Having examined the evidence for the AR8000, I'd love to have one. The one question I have to ask is - what are the alternatives? Especially, what are the used models (with full 800) that would be good to have? Or what are the less expensive alternatives to the AR8000? Then again, should I even consider something else?

* In a message originally to JBD@SPCFS2.NSC.COM

J>.find any information related to extending the PRO-51's
J>.frequency range via keyboard sequence. Anyone know about

Pro-51 and 23 only!

1. With the radio turned off, press and hold the 2. 9. and LOCKOUT keys; turn the radio on and release the keys.

2. Step to channel 23 on the PRO-51 or channel 15 on the PRO-23 to display 888.960 Mhz. a factory test frequency.

3. Press either the up or down search arrow to scan the cellular band in proper 30 KHz steps. You can temporarily store up to ten active cellular frequencies by pressing MONITOR.

Permanently store these frequencies for scanning and searching:

1. STEP to the desired MONITOR channel and press PROGRAM, followed by the desired memory channel number (including those with

factory-pre programmed test frequencies).

2. Press in sequence PROGRAM, MONITOR. ENTER. Repeat steps 1 and 2 for each channel to go into memory.

I heard the LAPD is going to digital, on some communications too, but
I suspect it will be for two-way communications they want more
secure. To go fully digital, or even some trunking, may be a bit
difficult at present. If only because, other nearby agencies, and
even other local police departments, do have needs to listen, and
sometimes participate, in LAPD communications. For example, I did
recently hear Cal State Northridge security, talking and participating
with the LAPD with a police chase that started at the campus, on my
scanner. I would assume, they would need continued access, and the
logistics of this would have to be figured out first.

C->Organization: University of Memphis
C->Nntp-Posting-Host: wok-47.memphis.edu
C->X-Newsreader: WinVN 0.92.1
C->Lines: 10

C->I seem to be having a problem with the reception of my Pro-43 while it
C->is in a mobile setting. The problem is not in the form of noise but rather
C->a loss of signal. This problem increases with the speed of the
C->vehicle(not certain but doesn't seem to be RPM related.) The unit
C->had a properly done Cell mod from day one. Any help would be appreciated as
C->my Valentine 1 need a mate. :)

As you mention the cell mod, I will assume you are having trouble in
the 800 range. As the wave form is so short up there,(37 cm/14 inches)
as you drive, you go in and out of phase with the signal rather quickly,
so quickly that the signal "picket fences".

Hope this helps.

BTW, I don't know what you can do about it :-(

Ifyou are looking for a good used scanner for cellular, then you may
want to pick up a Pro-2004. Radio is easily modified by clipping a diode
and putting it back together. The 2005 or 2006 may be easily modified
also. These are good, general coverage recievers that seem to take the
abuse.

Scott.

Message-ID: <dpm3.380.000857DA@dpm3.seanet.com>

I have been listening to a high volume of traffic on 130.875 here in the Seattle area, but ahve been unable to determine which airline it is. It is at least as busy as Alaska Air (local hub) at times. Tonight, sporadic listening had flts 191 off @ 1942 (local time), 103 @ 2043, 488 @ 2050, 446 nad 414 both off @ 2045.

Anyone have any local Seattle airlince omcpany frequency info that would shed a light on this? If anyone else ahs questions on the local airline company freqs, I'd be glad to share what info I have.

> could not and there was nothing in that range. I dont believe that.
> Jeff
>
That range cannot be restored in the 2006. 520-760 is part of the TV
band. It's not likely that you would want to trouble yourself too much
to restore it. Aside from that, the IF of the 2006 lies in this range
(intentionally designed) since most people are not interested in
listening to TV and it sure beats having the IF designed somewhere above
or below where it is which WOULD restrict desireable listening frequencies.
Enjoy your scanner !

Radio Shack recently discontinued the PRO-2006, perhaps the best base/mobile scanner radio ever sold, and replaced it with the 1000 channel PRO-2035. Bob Grove reviewed the PRO-2035 in October 1994 Monitoring Times magazine. How does it stack up against the PRO-2006? Read on.

Background

In 1986, Radio Shack introduced the PRO-2004 wide band programmable scanner and it immediately captured the attention of hobbyists. The PRO-2004 was made by General Research Electronics and was different from other models of that era due to its large 300 channel capacity and nearly continuous frequency coverage of 25 to 1300 MHz. Key to the PRO-2004's superior performance over such a wide frequency range was the use of "up conversion," a design found in expensive commercial and military receivers.
The PRO-2004 was replaced by the PRO-2005 in 1989, which was upgraded to the PRO-2006 one year later. The PRO-2005 and PRO-2006 were manufactured using tiny surface mount components, and despite a different cabinet, display panel, and keypad, the PRO-2004 and PRO-2006 circuitry and features were very similar. The PRO-2006 scanned and searched faster and was more sensitive. Except for the use of a plastic case, the PRO-2006 was equal to, or better than the PRO-2004.
By 1993, the highly prized PRO-2006 was getting long in tooth. Uniden introduced the Bearcat 8500xlt, the first Bearcat scanner featuring up conversion and a tuning knob. Radio Shack's somewhat late response to the 8500xlt is the new PRO-2035.

The PRO-2035 analyzed in this review was purchased from a local Radio Shack store and bears a serial number near 3000.

Physical

The PRO-2035 is about 5/8" wider and 1/2" taller than the PRO-2006. Extra room in the spacious cabinet will interest experimenters and companies who may provide aftermarket accessories for the PRO-2035.
The dark plastic case has rounded corners, typical of contemporary "European" stying. The squelch and volume knobs are the same dark color as the front panel, and you can't see where they are set as Radio Shack opted not to paint the hairline marker grooves a contrasting color. You can paint a white groove in each knob using a small bottle of White Out correction fluid, a product intended for covering typing mistakes.
Although there is a jack for running the PRO-2035 from a 12 VDC source, Radio Shack refers to this model as a "home scanner."

Frequency Coverage

There is a typographical error on page 3 of the owner's manual which specifies that the PR0-2035 tunes the 470 - 805.750 MHz range. Coverage in this band actually stops at 520 MHz and resumes at 760 MHz. Despite the limits cited in the manual, the PRO-2035 tested for this article tuned 25 - 520, 760 - 823.995, 849.005 - 868.995, and 894.005 - 1300 MHz.
Lately, the most frequently posed scanner question on the Internet and computer bulletin boards is, "How can I modify my scanner to cover the cellular phone range?" The FCC no longer permits companies to sell scanners which cover the 800 MHz cellular phone frequencies or which can be easily modified to cover them. As sold in the USA, the PRO-2035 does not tune the cellular frequencies directly. This raises an interesting question for a product reviewer or scanner experimenter: If he or she finds an easy way to expand frequency coverage into the cellular phone band, should the information be published? Doing so could lead to a product recall.

Memory Features

The PRO-2006 has 400 conventional memory channels and 10 Monitor channels backed up by an ordinary 9 volt battery. The PRO-2035 has 1000 conventional memory channels and 100 Monitor channels backed up by a special 3 volt battery soldered onto the main circuit board. The owner's manual states memory contents will be retained for

up to 3 months in the event of a power interruption.
Both the PRO-2006 and PRO-2035 have 10 pairs of
search limits, but the PRO-2006 permitted searching only
one range at a time. The PRO-2035 is more flexible and
allows "linking" search ranges together sequentially. You
can set search range #1 limits to 46.61 - 46.97 MHz and
search range #2 to 49.61 - 49.97 MHz, for example, and the
PRO-2035 will alternate searching both ranges.
Here's a tip: If your favorite search range has one
or two birdies, or frequencies you want to skip, you can
break the range up into two or more sequential ranges and
link them together.
Not only are there a lot more channels in the PRO-
2035, but several new ways to manipulate them. By pressing
a few keys, you can:

1) zero all 100 memories in any single bank

2) zero all 1000 memories in all banks

3) zero all the locked out memories in any bank

4) display the number of "empty" channels in any bank. The PRO-2035
owner's manual refers to memories which contain 0.0000
as "empty" memories.

5) move all the nonempty channels in a bank downwards
to fill in the empty channels in the bank

6) transfer multiple Monitor channels into one or more banks

7) transfer all the channels in any bank into the Monitor channels

With so many channels, the PRO-2035 needs another
feature, but it's missing: it should skip over empty
channels automatically. Although the PRO-2035 scans twice
as fast as the PRO-2006, it still wastes time scanning
empty channels unless they are locked out. The bulk move
operations listed above clear the lockout on each
destination channel. Owners will certainly grow weary of
pressing the LOCKOUT and MANUAL keys for each empty
channel.
There are 10 banks of 100 channels each. Bank 1 is
for channels 1-100, bank 2 for 102-200, and so forth. This
is more difficult to use than the numbering convention
employed in the Icom R-7100, where bank 0 is for channels
0-99, bank 1 for channels 100-199, etc. With Icom's
numbering system, you can easily tell what bank a channel
is in by its first digit, e.g., that channel 650 is in bank
6. In the PRO-2035, channel 650 is in bank 7, and that's
confusing. All that aside, a better scheme would be to
have more banks and fewer channels per bank, say 50 banks
of 20 channels, or even user definable banks, because a

bank of 100 channels is really too large for sensible programming.

Almost 20 years ago, the Electra/Bearcat BC-250 incorporated a fantastic new feature termed "search and store." One could program a pair of frequency limits, start an automatic search, and store all active frequencies into a special scratchpad memory. The active frequencies could later be recalled and programmed into regular memory channels. Electra's scheme was elegant -- smart enough to store each active frequency once and only once. What's more, one could store unwanted frequencies, e.g., birdies and paging frequencies, into the scratchpad and they would be skipped during conventional searches. Today's Icom R-7100 receiver boasts a similar feature.

Scanner hobbyists were hoping Radio Shack would offer a search and store feature in its next premium scanner, and it did -- sort of. The PRO-2035 has an Auto Store mode which stores active frequencies found during a search into one or more conventional memory banks. Once all the empty channels are filled, the PRO-2035 emits a series of beeps and stops searching. There is a separate pair of frequency limits for Auto Store so you won't use up one of the 10 pairs mentioned earlier.

What a pity the Auto Store implementation is not all it could be. You cannot use it to skip unwanted frequencies. Worse, it will store the same frequencies over and over again into empty memory channels. Let's say you program the PRO-2035 auto store limits to search between 407 and 419 MHz, and specify that active frequencies will be stored in bank 4. You start the search and let it run while you run some errands, hoping that while you are away, the PRO-2035 will be catching dozens of interesting federal frequencies.

Upon returning, you find the PRO-2035 snared a busy Veteran's Administration hospital paging system and stored the same frequency in 30 channels! That's just what happened during the evaluation. Even with its limitations, the Auto Store mode is beneficial and a few new frequencies were found while using it.

Here's a tip not mentioned in the owner's manual -- you can use the Auto Store mode to intentionally store the same frequency in several channels. Set both the lower and upper auto store limits to be the same frequency, open the squelch, and start the auto store search. The PRO-2035 will chug along, storing your favorite police or other frequency in all the channels in the banks you selected.

The tests which follow were performed by switching an outdoor Antenna Specialists AV-801 antenna back and forth between a PRO-2006 and the PRO-2035.

Sensitivity

Spot checks were made to compare sensitivity by listening to the same weak signals on both scanners. Both radios were similarly sensitive except in three instances: the PRO-2035 was slightly more sensitive at 147 and 852 MHz and noticeable more sensitive at 460 MHz.
This could be splitting hairs, as my 10 year old Electra/Bearcat BC-300, an old design optimized for 4 bands, beat both Radio Shack models in the sensitivity department.

Dynamic Range

The PRO-2035 and PRO-2006 are high end models, and people who buy them are more apt to connect them to outdoor antennas. Therefore, it's important that they perform well in strong signal environments.
Perhaps the biggest performance difference between the PRO-2006 and our PRO-2035 became apparent when listening to weak signals in the presence of a strong station transmitting on another frequency. The PRO-2006 has much better dynamic range than the reviewer's PRO-2035. Using the PRO-2035, a moderately strong signal from the 460.525 MHz sheriff's repeater 10 miles distant wiped out weaker signals on frequencies 50 kHz in either direction and produced hiss on weak signals 100 kHz away. The desense phenomenon was a problem in the 155 MHz band, too. The PRO-2006 was not affected by these signals.
To explore the problem further, the PRO-2006 was replaced with a PRO-2005 and the tests run again. Neither the PRO-2005 nor PRO-2006 were desensitized by the moderately strong signals.

Images and Spurious Responses

The PRO-2004/5/6 series, the portable PRO-43, and the PRO-2035 use "up conversion," but the PRO-2035's 609.005 - 613.5 MHz first IF (intermediate frequency) is 2 MHz higher than the earlier models. We speculate the change was made to avoid interference problems which bothered some owners of the earlier scanners who lived near a channel 20 television transmitter. The TV signal mixes with one of the local oscillators and generated a third signal near 48.5 MHz, the 2nd IF, causing interference on several frequencies.
Although up conversion affords improved image rejection, triple conversion and frequency synthesis circuitry are complicated and several images were heard, especially on the PRO-2035.
On both the PRO-2006 and PRO-2035, images of paging transmitters were audible in the 159 - 162 MHz range. Analysis shows these signals to be 771.9975 MHz higher than

the displayed frequency. For example, the 931.5125 MHz KOR933 paging transmitter, located more than 7 miles away, was heard when the PRO-2035 was tuned to 159.515 MHz. A paging image hindered reception of a sheriff's repeater in the next county on 159.15 MHz. The same paging images were present but barely detectable on the PRO-2006. Another image, heard only by the PRO-2035, appeared on 146.075 MHz, and it was actually a 904.075 MHz data transmission.
The PRO-2035 received cellular phone images, reduced in strength, between 1105 and 1115 MHz. The difference between the actual and displayed frequencies varied:

PRO-2035 tuned to (Image)	Actual transmitted frequency (Actual)	Difference (Actual - Image)
1105.550	870.450	235.100
1107.875	876.120	231.755
1110.900	881.100	229.800
1113.470	886.530	226.940
1114.840	893.160	221.680

New Features

The new tuning knob has a light feel but is a welcome feature nonetheless. A look inside the PRO-2035 revealed the tuning knob is connected to a special switch assembly rather than an optical chopper, or photo interrupter, used in higher price radios and computer mice. The knob can be operated as a channel selector or as a VFO control. We discovered a technique, not mentioned in the owner's manual, which let's one enter a frequency and tune around without actually storing the frequency. To tune around 154.6 MHz, for example,

1) press MANUAL (if not already in the manual mode)
2) press 154.6
3) press TUNE
4) rotate the knob in either direction to begin tuning

If you have never used a scanner with a tuning knob, you will be pleasantly surprised how handy it is to be able to tune around using a knob instead of fighting with the up and down keys on the PRO-2006.
While putting the PRO-2035 through its paces, the tuning knob was used in the VFO mode to chase down and identify a spurious paging signal, a "spur," which was drifting up and down the 2 meter ham band. The spur caused a serious interference problem to three area repeaters. Chasing a wandering spur requires the use of a

tuning knob and the PRO-2035 served well. The PRO-2006 was virtually useless in this application.

Other Considerations

The PRO-2035 specifications state 50 channels per second as the fastest scanning speed. Our PRO-2035 scanned slightly faster than 50 channels per second in a bank loaded entirely with 800 MHz NFM frequencies, and slowed to 40 channels per second in a bank purposely loaded with a mixture of frequencies in different bands and modes.
Some scanner buffs refuse to use the priority feature on their radios because priority sampling tends to "chop up" transmissions on nonpriority channels. The priority feature in the PRO-2035 is well behaved in this regard, and one can hardly tell it's enabled.
While the squelch on the reviewer's PRO-2035 had an acceptable amount of hysteresis, some users may wish to reduce it. That is, decrease the amount of "play" in the squelch control. One could lessen the hysteresis by replacing the tiny 100 Kohm surface mount resistor between pins 12 and 14 of IC-2, a TK10420, with a 220K or 330K ohm resistor.
Wine gets better with age. That's not true with the EL (electroluminescent) panel used to backlight the displays in the PRO-2004, PRO-2005, and PRO-2006. The EL panel grows dim as it is used. To prolong its life, GRE replaced the dimmer switch in later production PRO-2006s with a switch used to turn off the back light.
Instead of an EL panel, the new PRO-2035 utilizes LEDs (light emitting diodes) to illuminate the display, and that's an improvement. Unless overdriven, LEDs will work reliably for a very long time.

Summary

Being at the top of the Radio Shack scanner line, we expect a lot from from the PRO-2035. Its tuning knob and memory manipulation features are significant advantages over the PRO-2006. The discontinued PRO-2006 exhibited better dynamic range and fewer images and remains an excellent performer.
The PRO-2035 is a very good scanner. With a few changes, it could be a great scanner.
After this review was written, Uniden introduced the BC9000XLT top line base model, which the author tested and prefers to the PRO-2035. See the BC9000XLT review in Monitoring Times, March 1995 for more information.

: I have a scanner and would like to tune my homegrown antenna/coax
: to minimize SWR in the 139MHz to 143MHz frequency range.
...
: Also, I read somewhere that SWR is not important if you are
: only receiving a signal. Is this true or is it hogwash?

I'm writing this after reading 10 other replies, but I'll direct my reply to the initial post:

Whether receiving SWR matters or not depends on the situation. In general it matters a lot less for receiving than for transmitting, because given that your antenna supplies an adequate voltage to the receiver, increasing that voltage is going to increase equally the voltage of all signals in the passband of your receiver, both of the signal you want to listen to and the other signals and noise which interfere. Obviously for transmitting SWR is more important, because anything you do to increase your own radiated power gives you an advantage over other interfering signals at the input of someone else's receiver.

At lower frequencies the main problem in receiving is distinguishing a signal from other signals and noise picked up by the antenna, and thus SWR won't matter. At the frequencies you are interested in, however, noise generated inside the receiver starts to dominate over the noise picked up by the antenna, and efficient coupling to the antenna starts to become important. If you were interested in listening to very weak signals (such as moonbounce transmissions) SWR might be important. However, for the f.m. voice signals you listen to with a scanner it's probably not worth much effort.

On page 17 of Grove's May-June catalog is a block-type converter that pushes the shortwave bands up into bands most scanners have, allowing for such listening on a scanner. It connects to your antenna line naturally, and costs $100.00. I was thinking of buying one, just so I can make some more room on my bedroom desk, which has a RS-2006 scanner and a shortwave radio (which I use the least).
But is the device any good? I'm afraid my scanner will be quite deaf to the sw bands with it. Opinions?

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal

filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies.

Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal

portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC860XLT (Uniden): 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna.

BC9000XLT (Uniden): High quality base using up-conversion. 500 channels in twenty banks. Tuning knob. Selectable AM, NFM, WFM modes. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies.

BC100XLT (Uniden): Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): Excellent 400 channel portable. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance

difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO-2035: Radio Shack's 1995 top of the line 1000 channel base scanner. Cumbersome 100 channel bank size. Tuning knob. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2022: Base/mobile scanner. Like the PRO2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. |

PRO2037: Triple conversion all plastic base scanner made by | GRE. Home version of the PRO-62 portable but with more | intermod. 200 channels in 10 banks, one search bank, | selectable AM and FM. Uses up conversion circuitry but | inadequate front end filtering still allows images, though | not as bad as in 10.7 or 10.8 MHz IF circuits.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO62: Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different

IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43.

PRO43: Good portable 200 channel scanner using up conversion. Covers military air band. Selectable AM/NFM modes. Intermod in 160 - 162 MHz railroad band.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid

these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorla Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been

replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Parts for Plectron receivers are available from:

1528. Grove scanner beam?

Newsgroup: rec.radio.scanner

Russ, I have a Grove scanner beam and its very good. You can max out its capabilities by putting it on a cheap Radio Shack rotor. I also have an omni-discone, but rarely use it as it can't compare with the beam. I live just west of Washington, DC --- one evening not long after buying the beam, I turned it to the west northwest to listen to the Dulles International Airport tower. Well I got a tower alright - at O'Hare in Chicago!! That was not everyday reception, but it does give you an idea of how good the scanner beam is. Incidently, mine's hooked up to an ICOM R-7000. Hope this info is of use. Bill

I appreciate the results of your research. I bought both a glass
mount and mag mount antenna from my local RS. I figured I'd study
their designs and tradeoffs and figure out which one to install
later. I went with the mag-mount because it had a longer antenna
and I was worried about efficiency in the 150Mhz and below range.
It turns out that I made the right choice. :-) VHF reception with
the RS mag-mount is exceptional.

Thanks again,
Tim Henrion

A couple of people responded to a similar question of mine.
It appears that glass mount antennas are optimized (antenna length
and glass coupling) for the 450 Mhz range. I went with a mag-mount,
even though I'm not crazy about mag-mount antennas, because they
appear to be much more efficient in the VHF range. I got the RS
model and am very happy with it. Now I just have to see how fast
I can drive without the antenna blowing off. :-) I don't think I'll
have any problems because the actual profile of the antenna itself
is pretty low.

The new Pro-60 is set to retail at $349.95 as opposed to
$399.95 for the Pro-26. I wouldn't count on the Pro-60
being more capable than the Pro-26.

When there is something going on, lets like a fire, a command channel is usually set up. This is where the personel on the scene actually talk to each other. What are there frequencies???

thanx

Anthony

1534. Frequency Inverter

Newsgroup: rec.radio.scanner
Date: 1995-04-30 00:00:00 UTC
From: jwhitlow@iadfw.net
Message-ID: <jwhitlow-3004950924390001@ppp118.iadfw.net>
Source record: 257636

Does anyone have plans for a frequency inverter that I could plug between the speaker out on my 2006 and an external speaker/amplifier?

There were plans for an inverter in Electronics Now about a year or more ago, but I did not think to buy a copy...

1535. Re: MOTOROLA SECURE CLEAR??

>
> I returned the phone and got an AT &T 900 Mhz and love it. It has great
> range and as far as I know, it is impossible to listen in from a scanner.

I have both an AT&T and a Uniden. Both are great phones. However, only the Uniden is spread spectrum, AT&T does not yet make a spread spectrum 900Mhz. However, the AT&T is digital, so someone with a scanner would not know what they were listening to anyway.

The AT&T has a little bit better sound quality and ear comfort. The Undien can't be beat on range. I can walk about 50% further down my street with the Uniden.

1536. Re: NYPD Helocopter Freq?

Newsgroup: rec.radio.scanner

Message-ID: <3o0h1fgdc1@mhadg.production.compuserve.com>
Source record: 257638

Sri cant help with CH. "10"...but NYPD helicopters 'hang out'
on CITYWIDE-1 470.8375, along with highway patrol, emergency
service, marine division, etc.

When they are called to a precinct job, they will switch to the
frequency for the particular "division" the job is in.

IA>In a previous article, aj164@detroit.freenet.org (Gary Kolodziejczak) says:

IA>>
IA>>LOOKING FOR THE ULTIMATE RUBBER DUCKIE ANNTENA FOR MY HAND HELD,
IA>>ANY HINTS IDEALS SUGGESTIONS OR FREE FOOD, PLEASE SEND THEM MY WAY.
IA>>THANKS
IA>>GARY
IA>>
IA>There's no such thing as an "ultimate rubber duckie" antenna.
IA>They're usually considered to be just slightly better than
IA>a dummy load. A telescoping antenna that can be optimized for the
IA>frequency of interest would be a better choice for use with a
IA>handheld.
IA>--
IA>Chuck Reti Detroit.MI WV8A
IA>aa010@detroit.freenet.org
IA>--
My sentiments exactly Chuck, that's why I've personally labeled the
Rubber Duckie the "Dummy Duck".

For the person to whom you were responding to, they may try a antenna
from Radio Shack that sells for $9.95 or there abouts. It is a
Telescoping Antenna. It comes with a guide on the approximate length for
the band you choose to listen to or whatever. The antenna boasts a
coverage of 25 - 1000 MHz. It seems to work ok. I have a couple of them.
I don't use the one too often, but the other is on a Service Monitor.
I can definitely see a difference when the antenna is raised or lowered
to accomidate the frequncy that was selected.

Just my 2 cents....

ught
risingl
higher is better. It worked better
IR>|than any of the other antennas I use on my portable.

IR>Well, if this were a scientific experiment, your conclusion wouldn't
IR>be warrented based on the fact that you didn't use the SAME antenna
IR>at both ground level and on the roof. The TV antenna has gain in the
IR>horizontal plane, on the other hand, the coax introduces lost; without
IR>knowing what those actually measure out to be, you couldn't be certain
IR>if in "that higher is better"... you would only know that height MAY
IR>have contributed toward better scanner reception...

Higher is sometimes an advantage, but there are also times when it can
work against you. So, the theory that "Highter is better" really doesn't
apply.

I have the RS glass mount antenna. I have used them on two vehicles and they work very well. I haven't noticed any "loss". They mount easily. Make sure the glass is VERY clean inside and out. Position them carefully 'cause once on the glass you can't move it.

> James in Las Vegas
Converters usually work by shifting the frequencies to be received to a range the receiver can hear. This is done by mixing a locally generated frequency to the received signals and taking the sum and difference of the signals. It's hard to make this clear in just a few lines, but the idea is that the signals will be shifted, not divided. For example if you listen for two signals at 888 and 889 MHz after a converter they might be on 488 and 489, not 444 and 444.5. There are many reasons you don't want to use a divider to convert signals to be received. The mixing process is called hetrodyneing, and is well described in the ARRL Radio Amateur Handbook and many other references.

Boy, did you post to the right place. Here in Dartmouth there is a place called R&S Electronics on 306 Prince Albert Road. Their phone number is 464-0464. You want it, they got it. They carry scanners, cbs, security equip. hams and so on. I bought my Uniden BC 200 XLT from them. It comes highly reccomended from me. Includes battery pack, charger, antenna and a case.

Try measuring the output of the supplied charger. I believe you
will find it around 15 to 20 volts unloaded and around 13 to 15 while
loaded.

The battery pack has the regulator circuit built in!!

The 13.8 to 14.2 or so that most auto's put out, should not harm
anything. It was designed to use that range. Uniden sells the
adapter cord for the lighter plug.

Iowa State Patrol

(repeater outputs): 155.640
155.655
155.565

(LEA repeater outs): 155.790
155.685
155.700

On the above six, 1 & 4, 2 & 5 , 3 & 6 are for similar "post areas"

Car to car: 155.430
Air to ground: 155.505
CIS/Air to ground2: 155.445

Point to Point: 155.370
Mutual Aid: 155.475
State DOT enforcement: 155.970

All ISP radios are capable of scramble, but generally are not used.

Local frequencies can be found in numerous publications, including Radio
Shack's "Police Call".

> frequencies but that digital encryption will be common on some channels?
> Thanks,
> Dick Dillman

I heard the LAPD is going to digital, on some communications too, but I suspect it will be for two-way communications they want more secure. To go fully digital, or even some trunking, may be a bit difficult at present. If only because, other nearby agencies, and even other local police departments, do have needs to listen, and sometimes participate, in LAPD communications. For example, I did recently hear Cal State Northridge security, talking and participating with the LAPD with a police chase that started at the campus, on my scanner. I would assume, they would need continued access, and the logistics of this would have to be figured out first.

Ifyou are looking for a good used scanner for cellular, then you may want to pick up a Pro-2004. Radio is easily modified by clipping a diode and putting it back together. The 2005 or 2006 may be easily modified also. These are good, general coverage recievers that seem to take the abuse.

Scott.

1563. 130.875 @ SEA ....which airline?

Newsgroup: rec.radio.scanner

From: dpm3@dpm3.seanet.com
Message-ID: <dpm3.380.000857DA@dpm3.seanet.com>
Source record: 257665

I have been listening to a high volume of traffic on 130.875 here in the Seattle area, but ahve been unable to determine which airline it is. It is at least as busy as Alaska Air (local hub) at times. Tonight, sporadic listening had flts 191 off @ 1942 (local time), 103 @ 2043, 488 @ 2050, 446 nad 414 both off @ 2045.

Anyone have any local Seattle airlince omcpany frequency info that would shed a light on this? If anyone else ahs questions on the local airline company freqs, I'd be glad to share what info I have.

1567. A REALLY irritating sound...

Newsgroup: rec.radio.scanner
Date: 1995-04-30 00:00:00 UTC
From: accroya@ix.netcom.com
Message-ID: <3nv1ba$ehh@ixnews3.ix.netcom.com>
Source record: 257669

I promise to stop posting novice questions on here (and all of them answered very well!), but I have another one I've been wanting to ask.

Somewhere in the 450-480 range, there is a signal every day that really irritates me. It is a voice (or voices) accompanied by a loud squeal. The thing that bothers me is that it is EVERYWHERE. That entire range is ruined by the signal - it covers that much space. I thought maybe it was a nearby signal - but it happens all over town. I'll even send a brief sound file of it if someone would like to take a crack at figuring it out.

Thanks,
James in Las Vegas

Nope,

Typically, if a converter device/box is being used , it simply drops the
frequency that you would tune your scanner to down by 400. ie: to listen to
888 you tune in 488. Or in the case of the scanner itself being modified, the
actual frequency is tunable.

FG.

> could not and there was nothing in that range. I dont believe that.
> Jeff
>
That range cannot be restored in the 2006. 520-760 is part of the TV
band. It's not likely that you would want to trouble yourself too much
to restore it. Aside from that, the IF of the 2006 lies in this range
(intentionally designed) since most people are not interested in
listening to TV and it sure beats having the IF designed somewhere above
or below where it is which WOULD restrict desireable listening frequencies.
Enjoy your scanner !

From: Berton.Corson@f122.n2604.z1.fidonet.org
Message-ID: <e1e_9505031525@nisc.fidonet.org>
Source record: 257674

From: hbgeg066@huey.csun.edu (Berton Corson)
Subject: Grove's Shortwave Scanverter
Date: 30 Apr 1995 22:00:06 GMT
Message-ID: <3o1196$e6q@dewey.csun.edu>

On page 17 of Grove's May-June catalog is a block-type converter that
pushes the shortwave bands up into bands most scanners have, allowing
for such listening on a scanner. It connects to your antenna line
naturally, and costs $100.00. I was thinking of buying one, just so
I can make some more room on my bedroom desk, which has a RS-2006 scanner
and a shortwave radio (which I use the least).
But is the device any good? I'm afraid my scanner will be quite deaf
to the sw bands with it. Opinions?

Kirby_Ehler@SMTP.SVL.TRW.COM (Kirby Ehler) writes:

>Anyone know who sells hardware/software to control my 7100 from my
>Macintosh computer?

You need a CT-17 level converter or equivalent. It changes RS-232 voltages
to the TTL signals used by the ICOM equipment. Cost is about $100.

If you are using a mac, there will be less software available than on PCs
Writing your own requires a book that Icom publishes "Icom Communications
Interface V, Reference Manual". Cost is $13, available from Icom parts
dept. It has some of the wierd things that are used in the command structure.

Most of these are courtesy of RCMA Canada editor Rob Berezowski.

Vancouver Island RCMP A 140.400(R)
B 140.370(R) (Used in Comox)
C 140.310(R)
D 140.610(R)
E 140.580(R)
F 140.790(R)
G 140.280(R)
? 140.385(R)
TAC 1 141.150
2 141.180
3 141.210
4 141.300
5 141.240
6 155.595
7 155.700
8 155.850
9 155.670

BC Emergency Health Services Comox 149.830 (?)
Provincial Freq 149.680
(The frequencies may have changed for Vancouver Island. For EHS,
you can also try any of the following:
142.095
142.155
142.395
142.605

142.905
If you can't Comox area EHS on 149.830 or the 142 MHz channels
above, try the following:
149.110
149.155
149.260
149.440
149.590
149.680
149.890

(The above EHS frequencies are used province-wide, so you should be
able to find EHS on at least one of the channels above for whatever
location you're at.)

CFB COMOX

Military Police 149.350
Ground Vehicles 149.140

ATIS 118.6 282.2
Ground 119.75 250.3
Tower 126.2 358.1 236.6
Terminal 123.7 227.6
Arrivals 123.7 227.6 (may also use PAR freq)
PAR (Precision Approach) 127.0 128.1 134.1 283.7 289.4
335.9 342.9 378.5 384.5
Departures 123.7 227.6

442 Squadron Operations (CF-18's?) "Snake Ops" 135.9 363.0
407 Squadron Operations "Demon Ops" 308.6
414 Squadron Operations "Knight Ops" 278.4

Comox Base Operations 316.5
Comox Weather Briefers 344.6

Being a military base, the UHF frequencies would be used almost
exclusively, although the VHF frequencies may be used occasionally.
(They will certainly be used to communicate with civilian aircraft
within the zone.) The CF-18's will probably also have their own
discrete tactical channels. No idea what they are, you'll just have to
search through the whole UHF band if you want to try to find them.
Anti-submarine activities are also conducted out of Comox. As far as I
know, they do regular patrols of the ocean, looking for submarines.

BC Dept of Highways
143.295
143.415
143.445
143.895
One of these frequencies should be used near Comox.

Also, Comox Fire Dept may be on 153.830. I can't be sure of the
accuracy of that frequency, though.

I don't have many freqs for towns along I-80 but I can give you a short list of
the Troopers' state-wide repeaters. Give me a day or two to bring the list to
work--if I forget, email me directly.

I think what you are hearing is Intermod (intermodulation). There is probably
no easy way to avoid it, short of changing scanners or antennas. You are
right, it IS very annoying. That is why it is important to shop carefully for
a scanner.

Not even close. The lowest band is X @ 10.525 GHz (for Police Radar). The
HAM band is a little lower. After that is goes to the area of 24 GHz then
onto the new "Superwide" Ka @ 34.0-36.5 GHz. Laser is at 904 nM.

Message-ID: <D7x16M.9oG@nsc.nsc.com>
Date: Mon, 1 May 1995 20:06:22 GMT

Well, I'm about out of time and I need to buy
my first scanner soon. My local RS has several
good deals:

Pro-43 for $249
Pro-39 for $179
Pro-51 for $199

There seem to be many complaints regarding the audio
output and fidelity of the PRO-43 but I like the idea
of EPROM frequency storage.

The PRO-51 uses just 4 AA cells and has preprogramming
for non-hams like myself. It has the fastest scan/search.

The PRO-39 is cheap and can be altered for 860-900MHz which
doesn't matter to me but may make it easier to sell if I decide
to get rid of it.

Which would take to the race track?

Here is more accurate info for Uniden repair policy. I just had my
BC200xlt repaired (and it was returned ~4 days after their receipt card
was postmarked)

They repaired the scanner, replaced the battery pack (a $32 value) which
had a broken coax jack and the charger (~$10) on which the connector had
already been repaired once, all for $54 including return shipping. (w/
90day warranty)

What a deal, since I needed a new battery pack anyway!

Here is the complete Uniden flat rate repair price list:

Pagers $28
Telephones $40
scanners $54
CB $42
Marine $65
Radar Detectors $45
Satellite products - Receivers $90 Accessories %50
Cellular telephones $85
Commercial Communications $100

They will repair and return "out of warranty" items without furnishing
an estimate, unless the repair charges exceed the flat rate charges.

Phone number: 1800-297-1023

I hope this is helpful to some of you that might have scanner problems
in the future.

-Brian

For Sale: Radio Shack Pro-46 Handheld

Has BNC-type antenna mount with nine-inch antenna, volume, squelch,
earphone jack, weather, 100 channels (10 banks at 10 each). Covers 29-54,
108-136.975, 137-174, 406-512, 806-823.9375, 851-868.9375, 896.1125-956
MHz. Lockout, 1 priority channel, 10 monitor channels. Runs on 4 AA and has
charging circuit. Will include AC adaptor/charger. Bought it new 4 mos.
ago. Looking to upgrade to something with greater frequency range
and more bells and whistles. Radio Shack has this unit on sale
for $189.99 right now. I'm asking $90/obo. Will pay shipping.
No damage, no known anomalies.

Yes, yet another request for frequencies...

I was all psyched, I got my "Beyond Police Call" from RS and
programmed in my NASCAR frequencies. Drove to Flemington Speedway to
help a buddy of mine. Turned on the radio and heard only one active
channel - track cleanup.

Does anyone happen to have the frequencies for race control for this
track? NASCAR *does* run the event, but it looks like they use
different freqs than those listed in the book.

Thanks!

Speaking of reporters divuldging conversations overheard with scanners...

In article <395@sapphire.win-uk.net> scollin@sapphire.win-uk.net (Simon Collings) writes:

> If we are going to have laws against these activitives, they should
> be enforced. If there is no offence, then why have a law in the
> first place.

I suspect if it came to trial we would find that the prohibitions
about divuldging contents in the Communications act of 1934(?) don't
override the The first ammendment to the Constitution (free press).

Perhaps we can all claim that we are "Internet Correspondents" and get away
with it too.

Reporting to you live, now back to the net....

1595. Help with Regency HX1500 Problem

Newsgroup: rec.radio.scanner
Date: 1995-05-01 00:00:00 UTC
From: richard@larry.wyvern.com
Message-ID: <richard.799335051@larry>
Source record: 257475

My Regency HX1500 suddenly quit working. When I turn it on the
display shows "Fr Err" or frequency error. Batteries are good.
I cannot enter any normal frequencies as it thinks they are all
bad frequencies. The memory still has in it the frequencies
I listen to, mostly aircraft, and I can briefly see the frequency
on the display before "Fr Err" is displayed.

This unit sees little use and has always been treated with TLC.
When I last used the unit a few months ago it was fine. I took
it out to listen over the weekend and it had "spontaneously"
developed this problem.

Any help/ideas?

I think what you are hearing is Intermod (intermodulation). There is probably
no easy way to avoid it, short of changing scanners or antennas. You are
right, it IS very annoying. That is why it is important to shop carefully for
a scanner.

Here is more accurate info for Uniden repair policy. I just had my BC200xlt repaired (and it was returned ~4 days after their receipt card was postmarked)

They repaired the scanner, replaced the battery pack (a $32 value) which had a broken coax jack and the charger (~$10) on which the connector had already been repaired once, all for $54 including return shipping. (w/ 90day warranty)

What a deal, since I needed a new battery pack anyway!

Here is the complete Uniden flat rate repair price list:

Pagers $28
Telephones $40
scanners $54
CB $42
Marine $65
Radar Detectors $45
Satellite products - Receivers $90 Accessories %50
Cellular telephones $85
Commercial Communications $100

They will repair and return "out of warranty" items without furnishing an estimate, unless the repair charges exceed the flat rate charges.

Phone number: 1800-297-1023

I hope this is helpful to some of you that might have scanner problems in the future.

Hi Danny...
You don't say what kind of scanner you have. I have had good
results using a telephone pickup from Rat Shack plugged into the microphone
jack of my el-cheapo Rat Shack VOX microcassette recorder. The telephone
pick-up sticks nicely on the side of my pro-37's smooth plastic housing. In
the event that your scanner has a textured finish, stick on a small piece of
packing tape to create a smooth surface for the pickup's suction cup. 8)

Hope this was helpful...

Hi,

I believe that there is television and data there. Possibly some
covert ops but to far and few between to warrant listening there!
You have to put the 2006 into wide FM mode to listen to the audio from
whatever tv stations might be in that range. All and all, boring range.

Strings.

Hi,

You will absolutely be able to hear the freq.s you're interested in.
These scanners are not built with tight filtering because they are
so widebanded that filters would defeat the purpose.

I speak from experience with the scanner question. The only thing
that might stop you from hearing stuff is the crappy stock antennas they
come with. You should probably buy antennas for whatever different bands
interest you.

Happy scanning... strings. Half the calories, twice the value!

Hi,

It is also mainly used [in the USA] for pagers. Both data and
voice. There have been surveilance bugs here but pretty boring band.
Also the scanners are not optomized [hr in USA] for this band so receive
tends to be poor. Or at least not as sesitive as in the other bands.

Strings. Finger lickin' good.

Ca> I monitor have switched to "digital" or "digital encryption".

Ca> My question is, of course, how do I go about receiving the voice
Ca> transmission, and not the "white noise"? What equipment do I need.

Well, first off, you would need to spend a few thousand dollars on the radio that the public safety agency. Then, you will have to figure out what the digital code is that encrypts their signal. The only way you'll get that would be to take your radio to the agency and get it 'keyed'. There is 720(add 15 zeros to the end of the 720) possible keys that could be programmed into the radio, so trying to figure it out is out of the question. All this is for the DES system.

If they have gone to a straight digital format, you will need to find out the format that they are using. I don't know too much about the formatting of digital signals or the many types. At the present time, I don't know of any radios available to the public that can receive digital signals. Newpaper agencies may have access to one as a 'courtesy' from the police dept.

Good luck...Jerry

>There are some commercial coast stations that are taking care of that now, aren't
>there?

As I said in my article, the more ears listening to a distress frequency
the much better the chances of a distress not being missed. The
commercial coast stations are also monitoring dozens of other
frequencies besides 500 kc.

For Sale:
Bearcat 200 XLT Handheld scanner.

Excellent condition
2nd owner.
Spechs/Features:

BRAND NEW Metro West Long Life battery pack ($70 value alone!)
200 channels, 20 channels per bank x 10 banks
Range: 29MHz - 950 MHz (WITH CELLULAR, excluding the common excluded
freq's...)
Cellular mod done, long life battery mod done (extends the battery life
by 1-2 hours)
Wall charger
Belt Clip (After market, this thing holds up GREAT)
I'm only asking $200 /best offer for this. It's worth at LEAST that,
especially with the battery and
cellular mod, which you now can't get. Reply here, or e-mail
e_platt@ix.netcom.com. SERIOUS
INQUIRIES ONLY. Will deliver local or ship. (Bay Area = Local)

Message-ID: <3o1t0k$mer@freenet.vancouver.bc.ca>

Could someone please send me some frequencies for Vancouver Island? In particular, I'm looking for Nanaimo, Parksville, Port Alberni, etc on the way to the West Coast Trail. Then also some you can get in Victoria to Sooke(?) the Southern end of the Trail. In particular police/highway patrol freqs. In a week I have to drive some friends from nanaimo to the North end of the trail and then pick them up at the South end and come back through Victoria so I want something to listen to for the trip other than tapes.
Thanks.

Subject: NEW 2004/5 Button Pusher (via Dayton)
Message-ID: <mhbD7vxsz.IvK@netcom.com>
Date: Mon, 1 May 1995 05:55:47 GMT

NEWS FROM Dayton.....

Probably one of the most interesting things I found at Dayton (which I didn't expect to see) was a new 'button pusher' for either the Pro-2005 or Pro-2006.

The item is a little component board which interfaces into the existing keyboard cable. When installed (with or without a OS456), you can can download your 400 freqs in about 10 minutes. Just think, with the OS456, you know have the best of both worlds...remote computer control and the ability to download freqs for off-line scanning.

The product does come with a MS-DOS program, "Speed Loader", which allows one to manage frequencies with Alpha Descriptions (for PC managment purposes only). A 286-486 w/Dos 3.0 (or higer) is required. Even though the interface board has a DB-25 female connection, it does work via the parallel out on the PC.

Yes, I did pick one up. The manual seems provides STEP-BY-STEP assembly instructions, with troubleshooting tips and even a schematic. I haven't installed it yet...more later..

Product: SL-23 Scanner Interface Kit

Manufacture: The Right Connection
P.O. Box 31433
Dayton, OH 45437
(513) 258-0234 (voice)
(513) 258-FAX2 (fax)

Pricing: SRP US$89.95+$5.00 s/h ($30.00 opt. assembly charge)

For tracking purposes, tell them you saw the information here (they didn't seem aware of all the various electronic scanner forum services).

No, I don't get ANYTHING for posting this information...just trying to pass some info along..

In article <3ntdvn$a5l@news.wwa.com> Toby G. Garner, toby@wwa.com writes:
>Subject: Re: Mac computer controllers for 2006?

There is one interface, the OS456 which basically provides a serial
connection. Like any other serial device, another serial device
can communicate with it provided that the software is available.

The Mac, at this time, does not have the necessary software for
remote control of the OS456 equipped scanner. Like mentioned,
there is one in the works though.

Oh, I wouldn't recommend trying to run existing software under SoftPC.

Date: Mon, 01 May 1995 07:19:09 +0000
Message-ID: <bdj-0105950719090001@eblm01.ebl.rl.ac.uk>

A B-29 crash-landed near Thule, Greenland, in 1947. An attempt was made last year to fly it out but there were too many problems. One of the team died a couple of weeks later.

A second attempt will be made this month, I hear. Anybody know what freqs might be used for ground-ground and air-ground? Site too far from Thule for VHF, I imagine, so presumably will use HF at least some of the time. Get Thule HF here in UK quite often.

Subject: Some New Opto products...
Message-ID: <mhbD7vyw1.L3r@netcom.com>
Date: Mon, 1 May 1995 06:19:13 GMT

Product: ARCX-Cable
Price: SRP US$49
Requires: Scout

The SCOUT now tunes AOR!

Will tune the AR8000 and AR2700 to the freq. captured or freq. recalled
from memory on the Scout.

This cable interfaces between the CIV connection on the Scout and a
2.5 plug which is installed on/in the AOR scanner. The plug basically
ties into the existing interface, but provides a much more mobile
installation.

Between the Scout and scanner will be some type of little cable with a
protocol converter, about the size of 9V battery. The converter will
take care of the CIV to AR command translation.

This is not expected to ship till about the end of May.

For more info, contact Opto @ 305-772-2052.

Enjoy...

Mike Baranowski
mhb@netcom.com

1623. NEW OPTO CX12AR INTERFACE

Newsgroup: rec.radio.scanner
Date: 1995-05-01 00:00:00 UTC
From: Mike.Baranowski@f122.n2604.z1.fidonet.org
Message-ID: <e31_9505031525@nisc.fidonet.org>
Source record: 257503

From: Mike Baranowski <mhb@netcom.com>
Subject: New Opto CX12AR interface
Message-ID: <mhbD7vzI5.M8K@netcom.com>
Date: Mon, 1 May 1995 06:32:28 GMT

Product: CX12AR
Price: SRP US$99
Requires: Computer, any CI-V compliant device and/or AOR AR2700/8000

Computer Interface for CI-V & AOR
---
o Computer Control IF for AOR (AR8000, AR2700)
and CI-V (Icom-$900, R7000 & R7100)

o The ONLY converter with TWO operating modes:
Full duplex and CI-V

o Use to download memory from Scouth with Utility
Disk or Spectrum CD-ROM or to interface M1 for
datalogging

o Unique software controlled tape recorder output

o Dedicated Squelch Status input for R7000 & AR8000

o All cables, adaptors, and demo software included

o Supported by Scan*Star and ScanCat software

The product is basically and updated CX12 unit with some additional
functions added, like support for the AOR products

For the AOR products, a nice little pigtail adapter is supplied which
installs into the existing interface below the batteries. On the
other end of the adapter are TWO female mono plugs. From there, a
cable is used to connect the CX12AR to the AR8K/2700 scanner.

For more info, contact Opto @ 305-772-2052.

Enjoy...

Subject: FCC License Data Sources
Date: 1 May 1995 07:00:38 GMT
Message-ID: <3o20um$l33@news.tv.tek.com>

[last changed 03-Apr-95]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing FCC data, you might want to consider forming a co-op of people in your area to share the cost. As far as I can tell, this is legal since the information is in the public domain. However, the software supplied to view or manipulate the data is usually copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $103, and the mapping version is $173.

Floppies are available by state for $43 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. The US Index CD also covers the entire US but comes with much a more powerful database manager. Regional CDs cover subsets of the US but provide more detail about each license. Finally, the mother of all databases is the seven-CD Frequency Set, with data organized by frequency.

Spectrum costs $37, the US Index is $87, regional CDs are $107 each ($465 for the complete five-disc set), and the frequency set is $1515. Data is updated quarterly (the latest data is from Nov 94). PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), or Pergrim@aol.com (email).

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. The report includes a color plot with transmitter sites marked.

To create the report, Bob requires the latitude and longitude (or nearest | street intersection) of the center location. Reports are $26 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state,

covering all services and all frequencies. Data is updated approximately every six months (last update was Sep 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "#" or the field length, if known.

I find that this effect occurs a bit on a scanner with rubber duck.
However the effect is devastating on a CB with rubber duck.

Would this be because the CB is a lower frequency, or because the signal
strength is NEVER :-) above 4 watts??

>I don't use the one too often, but the other is on a Service Monitor.
>I can definitely see a difference when the antenna is raised or lowered
>to accomidate the frequncy that was selected.

I have one of these, but it seems not to outperform the rubber duck by
much on the 380MHz band and above. On lower bands, it helps at bringing
in the weak signals such as some hams, but the really powerful utility
signals seems to come in whatever aerial you have.

THe instructions seem to imply that for 68-88MHz and civil airband that
the aerial should be fully extended. But I find invariably that it is
better to collapse the bit just above the loading coil. When I tried
putting it onto a CB it seemed better fully extended.

The other problem with this sort of aerial: suppose that in one bank
you have a frequency of about 150MHz and one of 450MHz - how should the
aerial be set - for the weakest signal, for the lowest freq??

I am now the proud owner of a rather battered Yaesu FRG9600 along with the matching (CAT) computer interface.

Unfortunately, you guessed it, I have no software to interface the CAT to my IBM-PC.

Does anyone have experience of this system? or maybe knows of software that is commercially available.

in anticipation

I bought the Radio Shack case. It is a little on the big
size, but I use the extra room for storing the antenna and
some frequency lists. Works OK for me.

No problem. Radio Lorenz in Montreal is a very reputable firm that I
have dealt with on several occassions. They mainly service the local
crowd but have a good mail order setup. They carry products from
Ace-Aor, Drake, Grundig, Japan Radio, Kenwood, Lowe, Sony, Uniden,
Yupiteru and Panasonic.

I believe they offer two day shipping anywhere in the US so shipping
to NS should be no problem but check with them.

Radio Lorenz (514)-392-9200
482 St. Catherine St. West
Montreal, Quebec
Canada H3B 1A6

Ask for Helmut or Herbert Lorenz. Helmut is the shortwave nut mainly
responsible for the SW/scanner end and Herbert is more into the
audiophile section (high end stereo/TV systems/components).

No, I don't work for them or get paid. Believe it or not, in a city
the size of Montreal, there are only two "professional" outlets for
shortwave/scanning. Considering the claimed cosmopolitan/european mix
of this city... thats amazing. I bought my 535D from Progressive
Electronics (514 336-2423) but I don't think they do much mail order.
Check with them though, things might have changed.

Subject: Help with Regency HX1500 Problem
Date: 1 May 95 13:30:51 GMT
Message-ID: <richard.799335051@larry>

My Regency HX1500 suddenly quit working. When I turn it on the
display shows "Fr Err" or frequency error. Batteries are good.
I cannot enter any normal frequencies as it thinks they are all
bad frequencies. The memory still has in it the frequencies
I listen to, mostly aircraft, and I can briefly see the frequency
on the display before "Fr Err" is displayed.

This unit sees little use and has always been treated with TLC.
When I last used the unit a few months ago it was fine. I took
it out to listen over the weekend and it had "spontaneously"
developed this problem.

Any help/ideas?

Depends if there is any tinting in the window. This is usually a lead based
doping and it would greatly attenuate or render useless a window mount
antenn.

Actually "SWR" is the proper term. The word "Voltage" is sort of like
poundage or kilogrammage (From Dr. Shuch, N6TX - ARRL UHF/Microwave
Experimenter's Manual).

Any SWR which doesn't result in fire or coax failure is good. Proper SWR is
all the power being radiated as much as possible. Less than 2:1 would be
"good." 1:1 Excellent, 3:1 Poor.

Richard,
I think when this happens that one or more of the frequencies in memory
may be corupted. You may try enter new frequencies, also check the search
memories. The other posibility is that some thing has died in the
synthesizer, but I think I remember mine doing something like that some
years ago and it was not a serious problem.
If you find that it is a serious problem and you dont want to get it fixed
I would probly be interested in buying it from you.
TNX,
Dan

Subject: Theory Question
Date: Mon, 1 May 1995 15:45:18 GMT
Message-ID: <sjp117.1.2FA5020D@psu.edu>

Can someone explain to me what amplitude means when applied to radio waves.
What I can remember from high school physics and what I gather from reading,
is that it is the "height" of the wave. (hardly scientific, I know :-))

What is a practical example of amplitudes effects? Do FM signals have
amplitude? Does a 100 MHz signal have the same amplitude as a 400 Mhz signal?
Is amplitude even relevant to communications?

Any replies appreciated.

Your posting wasted a great deal of bandwidth, for two
reasons. The first reason is that you did not completely
read the article to which you were replying. Here is the
part (quoted in your response) that contradicts what you
said:

>
>>The following is a complete and up to date list of what I use and
>>have confermed in southern ontario for the emergency services.

Notice the phrase "in southern ontario" above.

Second, you reposted the entire frequency listing again.
Please don't do that.

Nice reply, Jeff. I never cease to be amazed at how many bullshit excuses those who drive illegally fast can come up with to try and cover their own lawbreaking.

I suppose that they slam on their brakes as well if the door opener device someplace, or other radar freq. source triggers their fuzzbusters. By Brian's reasoning, then EVERY SINGLE RF source in that frequency band is similarly responsible for causing accidents.

Brian - *drivers* are generally responsible for accidents, barring simple mechanical failures. If some people weren't spending so much time trying to figure out ways to speed (and thus LESS time paying attention to their own driving and that of others around them) they wouldn't have to worry about it.

People who *slam* on their brakes to avoid being caught breaking the law should probably be removed from the road as hazards, eh Jeff?

1645. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1995-05-01 00:00:00 UTC
From: bill@thd.tv.tek.com
Message-ID: <3o20um$l33@news.tv.tek.com>
Source record: 257536
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 03-Apr-95]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing FCC data, you might want to consider forming a co-op of people in your area to share the cost. As far as I can tell, this is legal since the information is in the public domain. However, the software supplied to view or manipulate the data is usually copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $103, and the mapping version is $173.

Floppies are available by state for $43 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. The US Index CD also covers the entire US but comes with much a more powerful database manager. Regional CDs cover subsets of the US but provide more detail about each license. Finally, the mother of all databases is the seven-CD Frequency Set, with data organized by frequency.

Spectrum costs $37, the US Index is $87, regional CDs are $107 each ($465 for the complete five-disc set), and the frequency set is $1515. Data is updated quarterly (the latest data is from Nov 94). PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), or Pergrim@aol.com (email).

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. The report includes a color plot with transmitter sites marked.

To create the report, Bob requires the latitude and longitude (or nearest | street intersection) of the center location. Reports are $26 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services and all frequencies. Data is updated approximately every six months (last update was Sep 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts

available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

Well, I'm still looking for someone that can supply me with the N.Y.
State Police Freq's, along with any other needed info. (CTCSS, etc.).

Please just don't send me a message saying "look at (insert favorite
scanner listing book here) ", because I live approx. 30 miles north of
the border (i.e. in Canada), and can't purchase those books anywhere
around here.

Any help would be appreciated.

Thanks.....
....Rob

When do you listen? If you listen in the evenings you won't hear that much.
I setup a VOX tape recorder and tape the daytime activity, BIG difference.

Depends if there is any tinting in the window. This is usually a lead based doping and it would greatly attenuate or render useless a window mount antenn.

But the phone, being an RF-emitting device, DOES need to meet FCC
certification before it can be sold. And the FCC could make it, gee, awful
tough to get certification if pressured from, say, the NSA...

Actually "SWR" is the proper term. The word "Voltage" is sort of like
poundage or kilogrammage (From Dr. Shuch, N6TX - ARRL UHF/Microwave
Experimenter's Manual).

Any SWR which doesn't result in fire or coax failure is good. Proper SWR is
all the power being radiated as much as possible. Less than 2:1 would be
"good." 1:1 Excellent, 3:1 Poor.

: Any help/ideas?
: --
: richard@infi.net, Norfolk, Virginia, USA

Richard,
I think when this happens that one or more of the frequencies in memory
may be corupted. You may try enter new frequencies, also check the search
memories. The other posibility is that some thing has died in the
synthesizer, but I think I remember mine doing something like that some
years ago and it was not a serious problem.
If you find that it is a serious problem and you dont want to get it fixed
I would probly be interested in buying it from you.
TNX,
Dan

>recorder?

Hi Danny...
You don't say what kind of scanner you have. I have had good
results using a telephone pickup from Rat Shack plugged into the microphone
jack of my el-cheapo Rat Shack VOX microcassette recorder. The telephone
pick-up sticks nicely on the side of my pro-37's smooth plastic housing. In
the event that your scanner has a textured finish, stick on a small piece of
packing tape to create a smooth surface for the pickup's suction cup. 8)

Hope this was helpful...

Hi,

I believe that there is television and data there. Possibly some
covert ops but to far and few between to warrant listening there!
You have to put the 2006 into wide FM mode to listen to the audio from
whatever tv stations might be in that range. All and all, boring range.

Strings.

1656. Re: Why can't I enter these freqs. on my Pro-51

Message-ID: <3o1h9e$pdt@dockmaster.phantom.com>
Source record: 257547

Hi,

You will absolutely be able to hear the freq.s you're interested in.
These scanners are not built with tight filtering because they are
so widebanded that filters would defeat the purpose.

I speak from experience with the scanner question. The only thing
that might stop you from hearing stuff is the crappy stock antennas they
come with. You should probably buy antennas for whatever different bands
interest you.

Happy scanning... strings. Half the calories, twice the value!

Hi,

It is also mainly used [in the USA] for pagers. Both data and
voice. There have been surveilance bugs here but pretty boring band.
Also the scanners are not optomized [hr in USA] for this band so receive
tends to be poor. Or at least not as sesitive as in the other bands.

Strings. Finger lickin' good.

1658. Vancouver Island Freqs

1660. NEW 2004/5 Button Pusher (via Dayton)

Newsgroup: rec.radio.scanner
Date: 1995-05-01 00:00:00 UTC
From: Mike Baranowski <mhb@netcom.com>
Message-ID: <mhbD7vxsz.IvK@netcom.com>
Source record: 257551

NEWS FROM Dayton.....

Probably one of the most interesting things I found at Dayton (which I didn't expect to see) was a new 'button pusher' for either the Pro-2005 or Pro-2006.

The item is a little component board which interfaces into the existing keyboard cable. When installed (with or without a OS456), you can can download your 400 freqs in about 10 minutes. Just think, with the OS456, you know have the best of both worlds...remote computer control and the ability to download freqs for off-line scanning.

The product does come with a MS-DOS program, "Speed Loader", which allows one to manage frequencies with Alpha Descriptions (for PC managment purposes only). A 286-486 w/Dos 3.0 (or higer) is required. Even though the interface board has a DB-25 female connection, it does work via the parallel out on the PC.

Yes, I did pick one up. The manual seems provides STEP-BY-STEP assembly instructions, with troubleshooting tips and even a schematic. I haven't installed it yet...more later..

Product: SL-23 Scanner Interface Kit

Manufacture: The Right Connection
P.O. Box 31433
Dayton, OH 45437
(513) 258-0234 (voice)
(513) 258-FAX2 (fax)

Pricing: SRP US$89.95+$5.00 s/h ($30.00 opt. assembly charge)

For tracking purposes, tell them you saw the information here (they didn't seem aware of all the various electronic scanner forum services).

No, I don't get ANYTHING for posting this information...just trying to pass some info along..

>Subject: Re: Mac computer controllers for 2006?

There is one interface, the OS456 which basically provides a serial
connection. Like any other serial device, another serial device
can communicate with it provided that the software is available.

The Mac, at this time, does not have the necessary software for
remote control of the OS456 equipped scanner. Like mentioned,
there is one in the works though.

Oh, I wouldn't recommend trying to run existing software under SoftPC.

1663. Thule freqs for B-29 rescue

Newsgroup: rec.radio.scanner
Date: 1995-05-01 00:00:00 UTC
From: bdj@ib.rl.ac.uk
Message-ID: <bdj-0105950719090001@eblm01.ebl.rl.ac.uk>
Source record: 257554

A B-29 crash-landed near Thule, Greenland, in 1947. An attempt was made last year to fly it out but there were too many problems. One of the team died a couple of weeks later.

A second attempt will be made this month, I hear. Anybody know what freqs might be used for ground-ground and air-ground? Site too far from Thule for VHF, I imagine, so presumably will use HF at least some of the time. Get Thule HF here in UK quite often.

1664. Some New Opto products...

Newsgroup: rec.radio.scanner
Date: 1995-05-01 00:00:00 UTC
From: Mike Baranowski <mhb@netcom.com>
Message-ID: <mhbD7vyw1.L3r@netcom.com>
Source record: 257555

Product: ARCX-Cable
Price: SRP US$49
Requires: Scout

The SCOUT now tunes AOR!

Will tune the AR8000 and AR2700 to the freq. captured or freq. recalled
from memory on the Scout.

This cable interfaces between the CIV connection on the Scout and a
2.5 plug which is installed on/in the AOR scanner. The plug basically
ties into the existing interface, but provides a much more mobile
installation.

Between the Scout and scanner will be some type of little cable with a
protocol converter, about the size of 9V battery. The converter will
take care of the CIV to AR command translation.

This is not expected to ship till about the end of May.

For more info, contact Opto @ 305-772-2052.

Enjoy...

1665. New Opto CX12AR interface

Newsgroup: rec.radio.scanner
Date: 1995-05-01 00:00:00 UTC
From: Mike Baranowski <mhb@netcom.com>
Message-ID: <mhbD7vzI5.M8K@netcom.com>
Source record: 257556

Product: CX12AR
Price: SRP US$99
Requires: Computer, any CI-V compliant device and/or AOR AR2700/8000

Computer Interface for CI-V & AOR
---
o Computer Control IF for AOR (AR8000, AR2700)
and CI-V (Icom-$900, R7000 & R7100)

o The ONLY converter with TWO operating modes:
Full duplex and CI-V

o Use to download memory from Scouth with Utility
Disk or Spectrum CD-ROM or to interface M1 for
datalogging

o Unique software controlled tape recorder output

o Dedicated Squelch Status input for R7000 & AR8000

o All cables, adaptors, and demo software included

o Supported by Scan*Star and ScanCat software

The product is basically and updated CX12 unit with some additional
functions added, like support for the AOR products

For the AOR products, a nice little pigtail adapter is supplied which
installs into the existing interface below the batteries. On the
other end of the adapter are TWO female mono plugs. From there, a
cable is used to connect the CX12AR to the AR8K/2700 scanner.

For more info, contact Opto @ 305-772-2052.

Enjoy...

>Jeffrey
>NH6IL
>(ex So. Cal. fireman)

Nice reply, Jeff. I never cease to be amazed at how many bullshit excuses those who drive illegally fast can come up with to try and cover their own lawbreaking.

I suppose that they slam on their brakes as well if the door opener device someplace, or other radar freq. source triggers their fuzzbusters. By Brian's reasoning, then EVERY SINGLE RF source in that frequency band is similarly responsible for causing accidents.

Brian - *drivers* are generally responsible for accidents, barring simple mechanical failures. If some people weren't spending so much time trying to figure out ways to speed (and thus LESS time paying attention to their own driving and that of others around them) they wouldn't have to worry about it.

People who *slam* on their brakes to avoid being caught breaking the law should probably be removed from the road as hazards, eh Jeff?

1667. Which one, PRO-43, Pro-39 or Pro-51?

Newsgroup: rec.radio.scanner
Date: 1995-05-01 00:00:00 UTC
From: jbd@spcfs2.nsc.com
Message-ID: <D7x16M.9oG@nsc.nsc.com>
Source record: 257558

Well, I'm about out of time and I need to buy
my first scanner soon. My local RS has several
good deals:

Pro-43 for $249
Pro-39 for $179
Pro-51 for $199

There seem to be many complaints regarding the audio
output and fidelity of the PRO-43 but I like the idea
of EPROM frequency storage.

The PRO-51 uses just 4 AA cells and has preprogramming
for non-hams like myself. It has the fastest scan/search.

The PRO-39 is cheap and can be altered for 860-900MHz which
doesn't matter to me but may make it easier to sell if I decide
to get rid of it.

Which would take to the race track?

Source record: 257569

I am now the proud owner of a rather battered Yaesu FRG9600 along with the matching (CAT) computer interface.

Unfortunately, you guessed it, I have no software to interface the CAT to my IBM-PC.

Does anyone have experience of this system? or maybe knows of software that is commercially available.

in anticipation

For Sale: Radio Shack Pro-46 Handheld

Has BNC-type antenna mount with nine-inch antenna, volume, squelch, earphone jack, weather, 100 channels (10 banks at 10 each). Covers 29-54, 108-136.975, 137-174, 406-512, 806-823.9375, 851-868.9375, 896.1125-956 MHz. Lockout, 1 priority channel, 10 monitor channels. Runs on 4 AA and has charging circuit. Will include AC adaptor/charger. Bought it new 4 mos. ago. Looking to upgrade to something with greater frequency range and more bells and whistles. Radio Shack has this unit on sale for $189.99 right now. I'm asking $90/obo. Will pay shipping. No damage, no known anomalies.

No problem. Radio Lorenz in Montreal is a very reputable firm that I have dealt with on several occassions. They mainly service the local crowd but have a good mail order setup. They carry products from Ace-Aor, Drake, Grundig, Japan Radio, Kenwood, Lowe, Sony, Uniden, Yupiteru and Panasonic.

I believe they offer two day shipping anywhere in the US so shipping to NS should be no problem but check with them.

Radio Lorenz (514)-392-9200
482 St. Catherine St. West
Montreal, Quebec
Canada H3B 1A6

Ask for Helmut or Herbert Lorenz. Helmut is the shortwave nut mainly responsible for the SW/scanner end and Herbert is more into the audiophile section (high end stereo/TV systems/components).

No, I don't work for them or get paid. Believe it or not, in a city the size of Montreal, there are only two "professional" outlets for shortwave/scanning. Considering the claimed cosmopolitan/european mix of this city... thats amazing. I bought my 535D from Progressive Electronics (514 336-2423) but I don't think they do much mail order. Check with them though, things might have changed.

Well, that depends on what type of encryption you have. SOme of the new
phones (Escort) have a pretty decent encryption and Digital Spread
Spectrum, enough to keep almost everyone except the NSA off you back.
As for online security check out PGP. It uses MD5 and IDEA encryption
algorythms. It's so good the Govt has tried to block it's export and jail
the author. About as secure as you're going to get and much more secure
than the weakest link---the Human.

University of Texas has property in N. Austin and I noticed one
particular building with high security has about 5 discones on it.
they each have a red rotating light and one of them was flashing.

Are these types of antennas used for receiving only? What are they the
best for receiving?.. UHF Air?

They also have what appears to be a large HF antenna it's many wires in
the form of a teepee but also has wires that run around the circumference
about mid way up.

>Somewhere in the 450-480 range, there is a signal every day that really
>irritates me. It is a voice (or voices) accompanied by a loud squeal.
>The thing that bothers me is that it is EVERYWHERE. That entire range

Sounds like a pager. It takes quite a bit of RF activity to activate those little boxes on everyone's belt deep inside of buildings, so the pager transmitters use pretty high powers. Scanners, being wide-band receivers, can't really do much to filter out junk like this, so it gets into the radio, mixes in various ways, and you hear it everywhere.

This is where radio ceases to be neat and precise and starts to be a real analog art... If you can figure out the pager's exact frequency you can try to filter it out. Scan around the range you can hear it, and a little above and below. It should sound distorted everywhere but on it's real output frequency.

Filtering it is another problem altogether... on a portable scanner you don't really want to have external junk hanging off of the radio - too inconvenient. On a base scanner, you can get away with it. One simple method is to put a T in the feedline and hang a length of open-ended coax from the T. The coax has to be 1/4 wavelength long at the frequency you want to cut - something like 9" at 450 MHz. Start with a piece 10-12 inches long and snip a 1/4" at a time until the pager is reduced to a minimum. The notch isn't particularly sharp, so a few MHz +/- from the pager frequency will suffer too, but them's the breaks...

Subject: more antenna questions
Date: 2 May 1995 14:40:15 GMT
Message-ID: <3o5g8f$skd@ixnews4.ix.netcom.com>

These all pertain to mobile antennas. Any help to understand this will
be appreciated.

1. What is better or is there no difference in performance?
full wave,half wave,quarter wave ect...

2. I made a quarter wave antenna for the 150-160 mhz range and it works
really good. But.... why does my multi band radio shack magnetic mount
scanner antenna seem to work just as good.

3. How does the multi band antenna work. Is is a compromise or does it
act just like several different antennas. The way the thing is made is
it has 3 sections with 2 coils dividing them.

4. Where can I buy components to make my own antennas. Mounts and the
rods that make up the antenna.

I am pretty new at this but I have come to realize the antenna is VERY
important. What a difference when it is right!

Message-ID: <c570074.72.2FA65BA9@showme.missouri.edu>

For Sale: Radio Shack/Realistic Pro-39. For those unfamiliar with the radio
and its ranges, they're as follows.
200 Channels - 10 banks of 20 each
10 Monitor channels
2-speed scan
Coverage: 30-54, 108-136 (This is the full aviation band. Most radios,

including the -43, only have 118-136), 136-174, 380-512, 806-960.

Note that the frequencies listed above list full 800 Mhz coverage. The
radio's already been modified to receive cellular phone frequencies. It has
Nicad batteries and the charger with it. I'll throw in a pretty good
frequency listing (not the merely semi-useful Police Call, either) for
wherever the buyer lives plus a magnetic mount scanner antenna with full
30-960 Mhz coverage (cost me $22).

I'm asking $205. I'll pay shipping. Email me if interested.

>I have read several messages saying that you need a ham license to have a
>"radar recker"! Is it in the 902 MHz ham band?
>73's de Mike VE3XLS

Police X-band radar operates at 10.525 GHz, K-band at 24.15 GHz.
Many motion detectors operate on the X-band, so there are a lot of
cheap transmitters available at that frequency. That frequency
also falls in or near (I forget which offhand) a ham radio band so
these devices are often used by hams. Motion detector hardware
usually has a combination transmitter (Gunn diode) and receiver
mixer (diode) which generally fulfills all of your microwave
hardware needs for a X-band tranceiver (you still need some
other items).
These transmitters are usually low power (10 - 100 milliwatts)
which is really all you need at these frequencies (even for a
police radar jammer). In light of the fact that these are low
power and often used in motion detectors (which are not licensed),
you may not even need a license.
I have seen more powerful units (250 milliwatts) available.
Assuming that these require a license, a ham license should cover
you. Even if you are not licensed, how is anyone going to know
the difference between a 250 milliwatt transmitter and a
100 milliwatt transmitter? I wouldn't worry a whole lot about
a transmitter license.
However, if you want to jam police radar, you may be falling into
other legal areas like obstruction of justice -- definitely more
serious. Many radar jammers transmit a signal typically modulated
with a square wave to deceive police radar. I've seen a number of
police radar units that have a speaker which allows the officer to
listen to the Doppler shifts. Low frequency tones are heard when a
slow target is detected; high frequency tones are heard when a fast
target is detected. A jammer would sound like buzzing. An officer
could recognize this as an attempt to jam him. So there is a
definite risk of being caught with a jammer - it might not be for
speeding but it could be more serious.

FOR SALE:

AOR 1000XLT handheld scanner

- 1000 non-volatile, programmable channels in 10 banks of 100 channels each
- Continuous coverage from 500 kHz to 1300 MHz (including cellular) AM,NFM,WFM
- Scans at 20 channels per sec.
- 10 search banks, capable of locking out 100 frequencies per bank
- Includes nicads, charger, antenna, case and manual
- Radio is in excellent condition

This is an incredible scanner, I just have too many other toys and I don't use
it.

$ 299.00 OBO. Send e-mail to stutts@email.exide.com

These all pertain to mobile antennas. Any help to understand this will be appreciated.

1. What is better or is there no difference in performance?
full wave,half wave,quarter wave ect...

2. I made a quarter wave antenna for the 150-160 mhz range and it works really good. But.... why does my multi band radio shack magnetic mount scanner antenna seem to work just as good.

3. How does the multi band antenna work. Is is a compromise or does it act just like several different antennas. The way the thing is made is it has 3 sections with 2 coils dividing them.

4. Where can I buy components to make my own antennas. Mounts and the rods that make up the antenna.

I am pretty new at this but I have come to realize the antenna is VERY important. What a difference when it is right!

Source record: 257377

For Sale: Radio Shack/Realistic Pro-39. For those unfamiliar with the radio and its ranges, they're as follows.
200 Channels - 10 banks of 20 each
10 Monitor channels
2-speed scan
Coverage: 30-54, 108-136 (This is the full aviation band. Most radios, including the -43, only have 118-136), 136-174, 380-512, 806-960.

Note that the frequencies listed above list full 800 Mhz coverage. The radio's already been modified to receive cellular phone frequencies. It has Nicad batteries and the charger with it. I'll throw in a pretty good frequency listing (not the merely semi-useful Police Call, either) for wherever the buyer lives plus a magnetic mount scanner antenna with full 30-960 Mhz coverage (cost me $22).

I'm asking $205. I'll pay shipping. Email me if interested.

>1. What is better or is there no difference in performance?
> full wave,half wave,quarter wave ect...

Usually a 5/8 wave or 1/2 wave antenna would be best, but there are also other configurations called colinear antennas that use a combination to achieve more gain. In an omnidirectional antenna (like a whip) the gain is achieved by making the antenna more sensitive to waves in a similar plane as the antenna, so signals from above or below are not heard as well. A true omni antenna has a pattern like a perfectly round sphere. An antenna with some "gain" will flatten out the sphere, making it more directional. One other thing to remember is that a long antenna like a 5/8 wave or 1/2 wave VHF antenna, will usually NOT outperform a 1/4 wave while you are driving down the highway. The flexing of the long antenna at higher speeds makes it less effective, while the more rigid 1/4 wave will not change its performance.

>2. I made a quarter wave antenna for the 150-160 mhz range and
it works>really good. But.... why does my multi band radio shack magnetic
mount>scanner antenna seem to work just as good.

Unless you made a log-periodic antenna or a discone, your antenna is really only resonant at a single frequency, so the gain will drop off quickly as you tune away from the resonant frequency. See question 3.

>3. How does the multi band antenna work. Is is a compromise or does it
>act just like several different antennas. The way the thing is made is
>it has 3 sections with 2 coils dividing them.

A multiband antenna will use "traps" to make a section of the antenna to look resonant at a particular frequency. For example, a frequency of 155 Mhz might see the whole antenna as resonant, while a 450 Mhz frequency will resonate a smaller section at the tip or between 2 coils. Many shortwave antennas use traps to make the antenna resonant on many different bands, although I think the implementation on an HF antenna is different than a VHF/UHF antenna.

>4. Where can I buy components to make my own antennas. Mounts and the
>rods that make up the antenna.

This is sometimes difficult. Hardware stores or sheet metal shops or welding shops can often help you with some of the materials. There are also some catalogs that might carry some components. I bought a defective CB antenna on clearance at Radio Shack, cut out the coil at the mag-mount base, cut the whip, and tuned it as 1/4 on 2meters for my HT - works great - only spent $10.

I have a 2026 with a 12V plug in the back that I can unhook from my car and take inside to a 12V adapter that I have plugged into the wall. The unit has a memory backup feature that will keep the 100 channels in memory "for up to 14 days if a power failure occurs" according to the manual.

It doesn't.

I brought it in the other day and let it sit for about 4 hours and all my channels were gone! I've had it for under a year, but probably close to 6 months and have been going back and fourth between car and home for about 6 days a week over that time. It is always plugged in except for the time that I am carrying it back and fourth.

Sounds like is has a Ni-Cad battery in there for memory and has developed a memory effect from the trips between car and home. Is that right, or is is a lithium battery that could be changed - like most computers have for clock memory?

If I can fix it, I'd like to do the work myself rather than have it go back into Radio Shack for X number of days, even though it is still under warranty.

Anybody else have the same problem?

Rich Barron

It >would be under the roof of the balcony above me and quite near the >building. Should I try one anyway or just use the mobile antenna? >

I have the Diamond D-130J discone antenna mounted 10 feet off the ground and it works very well on all bands. I am using an AOR AR-3000A scanner which also covers HF. While the signals are weak, the discone does receive HF. It has continuous coverage of 25MHz to 1300Mhz (1.3GHz) and receives extreamly well. I can receive cordless phones (46MHz) up to one mile away. I also use my discone for V/Uhf HAM radio operations.

>range. What I would like to know is what is the fromula for calculating
>the length for the 100-200mhz range. I would like to cut it for that
>length.

There are several differant formula's in the ARRL hand book. One of them for a half wave dipole is 468 devided by Freq. in Mhz. This will give you the total length of a half wave antenna (both conductors). To make a quater wave, devide the answer by 2. A quater wave for 2 meters (146MHz) is approx 19 inches.

I hope this helps.

Flemington uses the "color dot" frequencies. 151.625 is the main one, I think. You should scan between 151 and 152, and 154 and 155. That's how I found them.

East Windsor, NJ Speedway is definately on 151.625.

And is there a way to convert cordless phones to a pair of intercoms?
Might involve changing some crystals or something as they both tx on the
same freq and rx on different freqs. But it would be nice to be able to
use the Panasonic KX-T9080B phones as intercoms. :)

Anyway, how do cordless phones work? Transmit and receive with the same
antenna at the same time?

1721. Re: The Media and Digital

Newsgroup: rec.radio.scanner
Date: 1995-05-02 00:00:00 UTC
From: Vaughan.Huska@odxabbs.tor250.org
Message-ID: <692_9505021841@tor250.org>
Source record: 257393

Hi, Gary.

-> The answer to the question about digital scrambling and its
-> impact on the news media can be summed up in one word:
-> "frustrating."

Fortunately, for us here in Toronto, the Metro Toronto Police
are not scrambled. It's the media frequencies that are. A total
reversal, wouldn't you say?

-> It does make it more difficult for us to keep the public informed,
-> especially if the police department in question is
-> not forthcoming when reporters call for information. Some
-> departments are very cooperative. Others stonewall or even
-> lie over the most insignificant things.

Needless to say, it makes your job most difficult or
ineffective.

-> Experiences shows, however, that those departments which
-> cooperate get better media coverage than those that don't.

That goes without saying.

-> Enlightened police officials endeavor to develop relationships
-> with reporters who cover their departments on a regular basis.

And the public too, I would presume as it would show that the
police department(s) in question have nothing to hide.

-> However, it should be noted that the scrambling of police
-> signals is typically directed less at the news media

....indeed.

-> and more toward thwarting the bad guys.

Unfortunate for the many of who respect the laws set out by
Canada and the U.S. regarding scanning. Some just abuse the hell
out of it and use what they hear for personal gain. But some might
argue that the media does that as well. After all, we use the (police)
frequencies to monitor that shooting, car accident, what-have-you, and
race to the scene, burn some tape, get back and edit it with a snazzy
V.O.in hopes of producing a fantastic news story that will get the
people watching, run up the ratings and get the advertisers interested
in running some spots. Thus, the station(s) in question have made a
"personal", monetary gain from a frequency, in theory. But, that's a
whole other subject :)

-> Gary Baumgarten

Vaughan Huska

-> Reporter

EFP/ENG Sound Recordist

-> WWJ Newsradio 950

YTV Canada, Inc.

-> CBS Radio

It's a TV station, but I have worked in radio as a technical producer

-> Detroit

Toronto

I get Scanner Journal from the RCMA and Pop 'Comm. I don't really think Pop 'Comm is worth the money. Scanner Journal on the other hand is much better. It has state by state articles and areas like aircraft, sports/spec events, military. It's $15 a year and worth it. As for Pop 'Comm I'm letting my subscription run out.

I dont know where people are getting their facts. There must be some
seriously misinformed people in the world. Why would it be illegal to receive
a signal that someone else is transmitting. If you have the legal means to
receive it, i.e. a scanner and a published listing, then what law are you
violating?????? Show it to me if you can....
Anyone wants a list can ask me for it, its a small band with a simple
subdivision to it. Ask me, woody1@teleport.com

>casato_jc@atc.alcoa.com

My experience that beyond trunking there is digital encryption. Process by which analog signal are transformed into 1's and 0's. Depending on the digital bank size there could be anywhere from 100 to 10,000 different encryption codes for decoding the analog signal. You would need to obtain a decoder of the same make and model and in addition you would need the decoding bank combination, something most police departments are not going to hand you as it is not considered public information. FCC frequencies are public inforamation but the decoding bank code is not, just like your high school locker combination.

OOOOpppps... I have errored. I have misread my information in reguards to a
previous posting that I left..... Sorry.

Clints right, to a point..... The Feds say it illegal, and dont want anymore
scanners made to cover that band. However, they are not doing much in
enforcement and collection on all the scanners that are out there. So, what
are they really trying to say??? What does it matter?? Cellular is going
digital anyway. Sorry about the misinformation.

Get Soft PC for the Mac, and you can use the DOS control programs. If you
have a high-power Mac, you can run Soft Windows, and run the Windows
control programs.

I have seen a couple of Mac programs, but have no details for them.

1746. Useful BC-200 (& others)

Newsgroup: rec.radio.scanner
Date: 1995-05-02 00:00:00 UTC
From: Fig@f122.n2604.z1.fidonet.org
Message-ID: <e6f_9505031525@nisc.fidonet.org>
Source record: 257418

From: fig@fig-ppp.caltech.edu (Fig)
Subject: Useful BC-200 (& others) mod tip
Date: Tue, 02 May 1995 01:38:46 -0800
Message-ID: <fig-0205950138460001@fig-ppp.caltech.edu>

For those thinking of speeding up their BC-200 (Pro-35 or other
similar vintage Uniden) ...

[1] Newark's latest catalog just came (possibly out for a while), and they
now carry Murata (muRata) crystals ... p. 359 of catalog 113. I couldn't
see a minimum order (except for outside US: $250). They're about $1/each,
so you could get a full set of 445(see note below), 480, 500, 640, 800,
1000 for ~$7. They have higher freq.s which might be useful for other
scanners.

[2] Having great success w/ clock-chipping my mac (25->44MHz) I was less
successful w/ the 400->1000 and 400->800 on a BC-200. Both worked, but
with a loss of signals. ie:
1000 kHz -- only the stongest 10% of signals would cause squelch to break
800 kHz -- only the 40-60% strongest of signals would cause sq. to break
(both are relative to unmodified). I bought the 200 over the pro-34
partly due sensitivity, so this was not acceptable.

Note that the above figures are for signals near 900MHz. Loss in other
bands was not nearly so great. If your signals are from known strong
sources (say, you're local to the sources you're interested in), then
the above would be acceptable.

I could easily see people doing either mod and not noticing, so i suggest
testing before and after.

All of the above were tried when getting Murata crystals was very hard
(took a total of 5 months), so i'd given up hope. Now that Newark has
them, i'm going to try the 480/500/640 sometime...

Note: I don't suggest the 455 ... only a ~10% improvement in speed and
the frequency of the CPU would be that of one of the IF's which would
seem to be a way to get interference. Also, the difference between
480 and 500 would be too small to try both.

bill...thanks for your post of FCC LICENSE DATA SOURCES

such product avails and comparisons (plus first hand user comments) are
really useful in a multi-product market.

one fact i've not seen when products are described...which i would
find useful...is how much space various software takes on
the hard drive...or whether it can be run off a floppy..also
whether its windows or dos compatable...or windows 95 compatable.

i keep upgrading this bucket of bolts computer, but i'm always
two steps and three generations behind whatever's hip (or is it hep?)

oh well. thank goodness for all those stations i pull in on my
fillings and root canal...

Get Soft PC for the Mac, and you can use the DOS control programs. If you
have a high-power Mac, you can run Soft Windows, and run the Windows
control programs.

I have seen a couple of Mac programs, but have no details for them.

: that is commercially available.

: in anticipation

The best software that I've seen for the FRG-9600 is produced by Computer Aided Technologies, P. O. Box 18285, Shreveport, LA 71138, orders (318) 636-1234, fax (318) 686-0449, bbs (318) 631-3082. There product is Scancat ($80) and Scancat Gold ($95). For the FRG-9500, you'll also want the squelch detect cable ($25). I've used Scancat for about two years and love it and I think it's the best software for this application that I've seen. I do not work for Computer Aided Technologies or Yaesu, just a _very_ satisfied customer.

For those thinking of speeding up their BC-200 (Pro-35 or other
similar vintage Uniden) ...

[1] Newark's latest catalog just came (possibly out for a while), and they
now carry Murata (muRata) crystals ... p. 359 of catalog 113. I couldn't
see a minimum order (except for outside US: $250). They're about $1/each,
so you could get a full set of 445(see note below), 480, 500, 640, 800,
1000 for ~$7. They have higher freq.s which might be useful for other
scanners.

[2] Having great success w/ clock-chipping my mac (25->44MHz) I was less
successful w/ the 400->1000 and 400->800 on a BC-200. Both worked, but
with a loss of signals. ie:
1000 kHz -- only the stongest 10% of signals would cause squelch to break
800 kHz -- only the 40-60% strongest of signals would cause sq. to break
(both are relative to unmodified). I bought the 200 over the pro-34
partly due sensitivity, so this was not acceptable.

Note that the above figures are for signals near 900MHz. Loss in other
bands was not nearly so great. If your signals are from known strong
sources (say, you're local to the sources you're interested in), then
the above would be acceptable.

I could easily see people doing either mod and not noticing, so i suggest
testing before and after.

All of the above were tried when getting Murata crystals was very hard
(took a total of 5 months), so i'd given up hope. Now that Newark has
them, i'm going to try the 480/500/640 sometime...

Note: I don't suggest the 455 ... only a ~10% improvement in speed and
the frequency of the CPU would be that of one of the IF's which would
seem to be a way to get interference. Also, the difference between
480 and 500 would be too small to try both.

Hello,

I'm looking for a scheme of a RS232 interface to the AR8000 scanner.
I know AOR sells an interface to this scanner but i would build it
by myself. Could anyone post infos about ?

Thanks in advance

Francesco - IW1BXL

bill...thanks for your post of FCC LICENSE DATA SOURCES

such product avails and comparisons (plus first hand user comments) are
really useful in a multi-product market.

one fact i've not seen when products are described...which i would
find useful...is how much space various software takes on
the hard drive...or whether it can be run off a floppy..also
whether its windows or dos compatable...or windows 95 compatable.
